FOREWORD

The second National Population and Housing Census of Ethiopia was conducted in all regions in 1994. However, the data collected in Somali Region in 1994 was found to have problems and as a result the 1994 Population and Housing Census Central Commission rejected the result and gave instructions that the census should be carried-out again. Based on this the census in Somali region was carried out again beginning 11 September 1997. This census is considered as part of the 1994 Population and Housing Census of Ethiopia. The Statistical Reports, which presented the detailed tabulations of the results of the census have already been produced. The Statistical Report for Somali Region was produced in February, 1998.

The 1994 Population and Housing Census of Ethiopia was conducted under the auspices of the Population and Housing Census Commission that was set up under Proclamation No. 32/1992. The Commission was chaired by the Prime Minister and the members of the commission were drawn from various relevant ministries. The Central Statistical Authority served as the Office of the Commission (Secretariat). Hence the processing, evaluation and analyses of the data collected in this census as well as its dissemination are the responsibilities of this office. The office found it necessary to present indepth analysis of the results of the census. Accordingly, the Analytical Report of the results of the census for Somali Region has been prepared. Thus, the Office of the Population and Housing Census Commission is pleased to present the census report "Population and Housing Census of Ethiopia, 1994: Results for Somali Region, Volume II- Analytical Report" for users.

The 1994 Population and Housing Census was a huge nation wide operation which could not be undertaken by a single organization. Regional, Zonal and Wereda Census Commissions and Kebele Census Committees were established to enhance and facilitate enumeration activities. In the conduct of the census, full cooperation and assistance of government and non-government organizations, external donor agencies and the public in general was obtained. A number of preparatory activities were also carried-out before the census enumeration was begun. Among the major census preparatory activities was the conduct of the Population and Housing Census Map Work. In the census map work the farmers' associations in rural areas and the urban dwellers associations in urban areas were sub-divided into enumeration areas with 150-200 households in rural areas and 150-200 housing units in urban areas. About 5-6 contiguous enumeration areas were grouped to form one supervision area. In this exercise enumeration area and supervision

II

area maps were also prepared. In the census map work operation a total of 49,978 enumeration areas and 9,845 supervision areas were formed in the settled rural areas and 8,724 enumeration areas and 1,575 supervision areas in the urban areas of the country.

Preparation of enumeration area maps is most useful in areas where the inhabitants are sedentary and housing units that are mapped during the cartographic work will still be existing in their respective localities during the census enumeration. Thus, in most parts of the rural areas of the region, census cartographic work was not undertaken because of the nomadic settlement pattern. The urban parts of Somali Region and the sedentary parts of its rural areas were covered by the census map work. However, most of the maps that were prepared for the rural areas were found to be outdated by the time of the September 1997 Census because of the formation of new FA boundaries and could not be used during the September 1997 census enumeration and were discarded.

Because of the lack of census maps for the September 1997 Somali Census, very wide pre-census Kebele and household listing exercises were launched. During the pre-census household listing exercise teams of listers moved from one house to the next listing the name of the head of the household and the number of the members of the household. The pre-census household listing operation fully covered most of the weredas of the region while a few of the weredas were only partially covered. The pre-census household listing activity was conducted from 22 July 1997 to 3 October 1997. The results from the household listing were utilized during the deployment of manpower and in the determination of the required census documents.

During the census, one supervisor was assigned per five enumerators. The supervisor was responsible to allocate the different localities in the farmers association areas to each enumerator. The supervisor was also responsible to complete the long questionnaire.

As was discussed earlier, the census operation in Somali Region was first attempted in October 1994. However, the results of this census were found to have problems. Because of this the Population and Housing Census Central Commission decided that the census enumeration in the region had to be done again. Then after undertaking the necessary census preparatory activities, the census enumeration was launched on 11 September 1997 and it was completed by the end of the month in all zones except Degahabur and Fiq Zones. Census enumeration in the other two zones was launched at the beginning of October 1997 and was extended upto

November 1997. The launching of the census enumeration in the two zones was delayed in order to make more efficient use of the manpower and logistical facilities deployed for the census. Since the census enumeration was launched on 11 September 1997 in the seven out of the nine zones of the region, the census report for Somali Region is taken to refer to 11 September 1997.

The Office of the Population and Housing Census Commission would like to thank all government and non-government agencies who participated in the organization of the census, the supervision of the field work, the data collection, and the respondents who participated in providing the necessary information. The government of Ethiopia has given huge financial and unreserved administrative support in undertaking the 1994 National Population and Housing Census from its inception till the dissemination of the results. This indicates the commitment and high priority offered by the government for socio-economic and demographic data collection, processing, evaluation and dissemination of the results to users.

The Office would also like to take this opportunity to express its many thanks to the United Nations Population Fund (UNFPA) to its generous financial assistance and technical support in conducting the census. Moreover, thanks are due to United States Agency for International Development (USAID) for its financial and technical assistance for the census. Further thanks are due to the United Nations Development Program (UNDP) and to the Swedish International Development Authority (SIDA) for their financial assistance. The office hopes that the data presented in this report will be found useful by all data users.

Abdulahi Hasen(Ph.D.)

Member
and
Secretary,
Central Census Commission

CHAPTER I

INTRODUCTION

This chapter presents an overview of the content of the census report "Population and Housing Census of Ethiopia, 1994: Results for Somali Region, Volume II- Analytical Report". It presents indepth analysis of the results of the census for Somali Region. The Statistical Report of the census results for Somali, which presented detailed statistical tables, have already been disseminated to users (CSA, 1998). The analysis on this report will be based on tables that have been presented in the Statistical Report and some additional tables that have been produced for this purpose.

Somali Region consists of nine administrative zones, 44 weredas, and 67 towns. The urban part of the region has 136 kebeles. Estimates of population sizes are provided for areas that were not covered in the census. The rest of the tables in the report present only information about areas covered in the census. For detailes concerning the areas not covered in the census, reference may be made to the Statistical Report (CSA, 1998).

The 1994 Population and Housing Census was the second national population and housing census ever to be conducted in the country. The first population and housing census was conducted in May 1984. The second Population and Housing Census of Ethiopia for most regions was conducted beginning 11 October, 1994 and was completed in most areas within the following ten days. The field enumeration for Somali Region was first done during October to December of 1994. However, the results of the 1994 census of this region were found to have problems. Therefore, the field enumeration for Somali Region was repeated from 11 September through 14 November 1997. Therefore, the census results for the region refer to 11 September 1997. The questionnaires used in the region were slightly different compared to those used in other regions. The questionnaires were prepared in Amharic. English translations of the questionnaires used in the census are presented at the end of the report. The types of questionnaires used were:

- i) Short Questionnaire (Appendix I)
- ii) Long Urban Questionnaire (Appendix II)
- iii) Long Rural Questionnaire (Appendix III)

The content of the short questionnaire was similar in urban and rural areas. The short questionnaires were filled-in by enumerators who went from one household to the next. The short and the long questionnaires differed on the number of variables collected. The data collected in the short questionnaire included basic information on population such as household sizes, sex, age, ethnic group and marital status. In addition to these, the data collected in the long questionnaire included information on language, religion, disability, education, economic activity, fertility, mortality and housing stocks and conditions. The long questionnaires were filled-in by the supervisors.

Enumerators filled-in all the short questionnaires. Supervisors filled-in two long questionnaires per area covered by an enumerator in the rural areas. The households selected for the long questionnaires were determined according to the location of the last household recorded in the short questionnaire at the time the supervisor arrived at a locality where an enumerator under his supervision was carrying-out the census enumeration. Then the supervisor filled-in the long questionnaire for the immediate two neighboring households. The enumerator continued with the rest of the households by filling-in the short questionnaires. The sampling procedure in the urban areas was done in a similar fashion, except that the number of households covered using the long questionnaire was raised to five. The number of households covered using the long questionnaire were 1,426 in urban areas and 5,771 in rural areas. The total number of conventional households in the region were 79,429 in urban areas and 429,678 in rural areas.

Some of the information presented in this report which referred to population sizes, sex and age composition and ethnic and marital distributions were collected from all persons covered in the census. However, some other information presented in this report was collected from only a sample of the population. This refers to language, religion, disability, education, economic activity, fertility, mortality, and housing stocks and conditions. Eventhough the above information was collected from a sample of the population, statistical weights were applied to the information collected in order to let them represent the entire population. This means that the

numbers presented in the tables that refer to language, religion, education, economic activity,... etc. represent the entire population covered in the census of Somali Region and not only the sample population.

The fact that the information was collected from a sample of households and not from the entire households does not make the information less reliable. In fact this process increases the quality of the information collected by reducing the work load that would have been faced if all households were covered using the long questionnaire. The reduction of the work load improves the quality of the data because it is expected to facilitate a closer supervision during field work, enable better data coding and editing, and enable the timely processing of the data collected. Details of the "Sampling Methodology for the Census Long Questionnaire" that includes sample design, evaluation of the data collected in the long questionnaire, estimation procedures of sampling errors, calculation of sampling errors, design factors,...etc will be presented in a separate report. The census was conducted by enumerators who went from house to house filling in the questionnaires designed for the purpose. Homeless persons were enumerated in the place where they were spending the night.

This report contains seven chapters. The first chapter serves as an introduction to the report. Chapter II deals with the population sizes, sex, age, language, ethnic, religious, and marital status distributions of the population. It also presents the disability condition in the region. Chapter III explores the educational characteristics of the population. Chapter IV deals with the economic characteristics of the population in the region. Chapter V presents fertility and mortality conditions. Chapter VI deals with the housing stocks and conditions in Somali Region while Chapter VII presents population projection of the region.

Homeless persons were enumerated using only the short questionnaire because the enumeration took place at night at the place where they were sleeping, and it was not convenient to apply long questionnaires in these situations. The Homeless persons were not included in the application of the statistical weights, for this reason slight discrepancies among the data of various tables can be observed.

CHAPTER II

POPULATION SIZE AND CHARACTERISTICS

2.1 Introduction

Determining the size of population of a country and its regions has been one of the basic objectives of conducting census or population counts since early time. This is because population size is directly related to the supply and demand for basic human necessities such as food, shelter, health and education facilities... etc.

According to the 1994 Ethiopian Population and Housing Census, as of September 11, 1997 the population size of Somali Region was 3,439,860. The census has counted people on de jure and de facto basis. In this census, the de jure population is taken to represent the actual size. The de jure population comprises all persons who belong to a given area at a given time by virtue of usual residence, while under the de facto approach people were counted as the residents of the place where they were found (Shryock et al., 1976). In the census, a person is said to be a usual resident of a household (and hence an area) if he/she has been residing in the household continuously for at least six months before the census day or intends to reside in the household for six months or longer. Thus, visitors are not included with the usual (de jure) population. Homeless persons were enumerated in the place where they spent the night on the enumeration day. The 1994 census includes foreign nationals who were residing in the region. On the other hand all Ethiopians living abroad were not counted.

2.2 Population Size and Density

The population size of Somali Region and its zones (including estimates of 56,695 persons for areas not covered during the census) is presented in Table 2.1. The rest of the tables in this report present the characteristics of the census counted population of the region. The 1997 census counted de jure population of 3,383,165 and de facto population of 3,327,662 for Somali Region. Out of the de jure population, 1,845,417 were males and 1,537,748 were females, giving a sex ratio of 120. The analysis in this and subsequent chapters is based on the de jure population.

	%	13.9	13.9	13.8	9.1	9.1	9.0	14.7	14.7	14.7

Urban-rural distribution of the population of Somali Region indicate that the overwhelming majority of the population is living in rural area. About 85.7 percent of the population reside in the rural areas of the region and the remaining 14.3 percent of the population is living in urban areas.(See Table 2.1)

Regarding spacial distribution of the population by zones, the 1997 Population and Housing Census result indicates that the population is not evenly distributed over zones. As can be observed from Table 2.1, Jigjiga Zone stood first, constituting about 23.6 percent of the total population of the region, this is followed by Liben with about 13.9 percent and Afder and Shinile Zones with 10.4 percent each, respectively. The census result reveals that Fiq Zone has a relatively less population (about 6.8 percent).

2.3 Age-sex Composition

Age and sex are among the most important items collected in all demographic inquiries. The age-sex composition is the product of past fertility, mortality and migration trends and in turn influences the trend of the population increase. It also influences the size of the school age population, the labor force and female population in the reproductive ages. Also, age-sex structure is vital for making component and sectoral projections. Age and sex are not only important by themselves but are also useful for an in-depth analysis of other socio-economic characteristics. Age is also important in using indirect estimation of demographic parameters.

2.3.1 Age Distribution

a) General Pattern

Age distribution of the population of Somali Region by five year age group is given in Tables 2.2a-2.2c and graphically shown in Figures 2.1a-2.1c. The Age structure of Somali Region which is typical of developing countries is characterized by much higher proportion at young ages and low proportion at old age , reflecting the prevailing higher fertility rate. As can be seen from Table 2.3, the population at young age group (<15 years) make up 50.8 percent of the total and those at old age groups (above 64) constitute 1.6 percent. The proportion of the population aged 15-64 , constitute about 47.6 percent of the total population.

Fig 2-1a Age Pyramid of Population of Somali Region- Urban+Rural : 1997

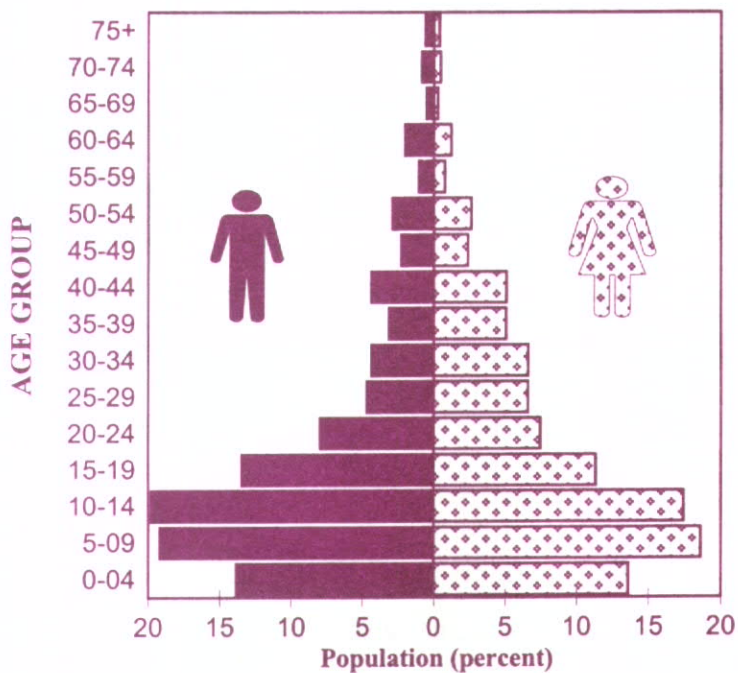

Fig 2.1b Age Pyramid of Population of Somali Region-Urban: 1997

Fig 2.1c Age Pyramid of Population of Somali Region-Rural: 1997

The age-sex composition of the population by functional age groups showed modest variation by zones (see Table 2.3). The population in the age group 0-14 varied from 47.64 percent in Jigjiga Zone to 55.32 in Fiq Zone, whereas those in the age group 15-64 ranged from 43.42 in Liben Zone to 50.48 in Shinile Zone, and those in the old age group (65 and over) varied from 1.03 in Fiq Zone to 2.07 in Jigjiga Zone. In all zones, the proportions of youth (aged 0-14) and old (65+) persons among males are higher than that of females. Likewise, the proportion of persons in the age group 15-64 is higher among females compared to males in all Zones.

b) Dependency Ratio

All persons in the so-called working ages do not actually participate in economic activities and all persons outside these ages are not also dependents. In spite of these, the ratio of persons in the dependent age groups to those of the working ages provide a useful approximation to economic dependency burden. The young, old and overall dependency ratios are calculated and given in Table 2.4. Young dependency ratio is defined as the ratio of population in the age group 0-14 to those in the age group 15-64 multiplied by 100. Similarly, old dependency ratio is defined as the ratio of persons aged 65 and above to those in the age group 15-64 multiplied by 100. The sum of young and old dependency ratios will give the overall dependency ratio. The data in Table 2.4 show that the overall dependency ratio of Somali Region is 110.2 with dependency ratio of 106.8 for the young and 3.3 for the old. This means, for each 100 persons in the productive age groups there are about 110 young and old dependents to be supported. Dependency burden in rural areas is higher than that of the urban areas.

2.3.2 Sex composition

The sex composition of a population holds a position of prime importance in demographic studies. Moreover, socio-economic development planning, both public and private, such as

Table 2.3 Percentage Distribution of population by Broad Age Group, Sex and Zone ,Somali Region:1997.

ZONES	AGE GROUP AND SEX

planning of community institutions and services, particularly health services, and planning of production and sales of goods and services...etc. require data on sex composition of the population. Sex composition is conveniently described by a series of 'sex ratios' for various categories of a population. The sex ratio is defined as the number of males per 100 females in a given population.

The overall sex ratio and sex ratios by five year age-groups are presented in Table 2.2a-2.2c. Evidences suggest that sex ratio at birth is around 120. However, since mortality rates are

greater among males compared to females, this ratio tends to reduce as age advances. As a result, under normal conditions (for instance, where there is no sex selective migration), the overall sex ratio is expected to be around 100. As can be seen from the table, however, the overall sex ratio of Somali Region is moderately high amounting to 120 males per 100 females. Sex ratio for rural Somali is particularly very high with about 121.3 males per 100 females.

As given in Table 2.2, sex ratios decline from high to low value as age advances. The 1997 census data for Somali Region, however, deviates from this general pattern. The ratio did not follow any definite pattern. The sex ratio of 107.8 for children under 1 is outside an acceptable range and increases up to the next four age groups (i.e., 1-4 and 15-19). For the 1-4 age group the ratio rises to 113.9 males per 100 females. Thereafter, in general it rises upto age group 15-19. Beyond this age group the sex ratios fluctuate from one age group to the other age group. In urban Somali, at age group 20-24 there are 113.9 males per 100 females and at age group 60-64 there are 140.9 males per 100 females. It is surprising to observe a very high sex ratio in the older age groups for rural areas. For example, in age group 65-69, there are 234.2 males per 100 females and in the 70-74 age group the ratio rises to 238.3 males per 100 females. The possible explanation for excess of males over females at the older age groups could be due to exaggeration of age by males.

2.3.3 Quality of Age-Sex Data

Though age is an easy concept to understand, when it comes to measurement, there are several problems. In the 1994 census of Ethiopia, age of respondents was determined by asking 'what is your age in completed years?'. Misreporting of age is a common problem in developing countries. Very few parents keep record of date of birth of their children and celebration of ones birth-day or issuance of birth certificate is uncommon in this part of the world. Ethiopia is not an exception. Ages in most cases are imputed either by the respondents and /or enumerators on the basis of linking the probable age with some presumably known events. It may happen that some people even fail to give clues from which their ages can be estimated. In such a situation, the estimation of age falls in the hands of the enumerators. Age data could also be affected when individuals of a given age have been missed or counted more than once. In view of these

considerations, it is necessary first to evaluate the quality of age data before undertaking any analytical work.

a) Age Heaping or Digit Preference

The population distribution of Somali Region in single year of age as depicted by the 1997 census is graphically represented in Figures. 2.2a-2.2c. As can be seen from the figures, the age distribution in single year is very erratic. Existence of error in the age data is manifested in clustering of ages ending in some digits and deficiencies at ages ending in others. The tendency of respondents and/or enumerators to report certain ages at the expense of others is termed as age heaping, or age preference, or digit preference. Scrutinizing Figures. 2.2a-2.2c reveals that there is serious age misreporting in the region's population at certain ages. This is the usual tendency among population counts taken in developing countries where most people don't know their exact age.

Irregularities in reporting single years of age can also be detected using indices. These indices not only provide an overall idea of the extent of age misreporting but also indicate the preference of digits that end with certain numbers. There are several frequently used indices for detecting digit preference in age reporting: Myers', Whipples, Bachi, Carrier, and Ramachandran (as quoted in US Bureau of the Census 1994). In this report, Whipple's and Myers' indices of digit preference are calculated and presented in Table 2.5.

Whipple's Index is a test usually employed to measure age preferences for terminal digits '0' and '5' as compared to other digits. If age data is accurate, value of Whipple's index is expected to be 100. The rating of the quality of age data for different values of Whipple's index is: less than 105 highly accurate data; between 105 and 109.9 fairly accurate data; between 110 and 124.9 approximate data; between 125 and 174.9 rough data; 175 and above very rough data. Accordingly, the 1997 census age data of Somali Region is very rough with relatively better age reporting in rural areas than in urban areas. This could also be due to age-sex selection of migration into urban areas. The findings in Tables 2.2a-2.2c also show slightly better age reporting for males than females in urban areas, while the opposite is true for rural areas.

Fig 2-2a Percentage Distribution of Population by Sex and Age in Single Year, Somali Region-Urban+Rural:1997

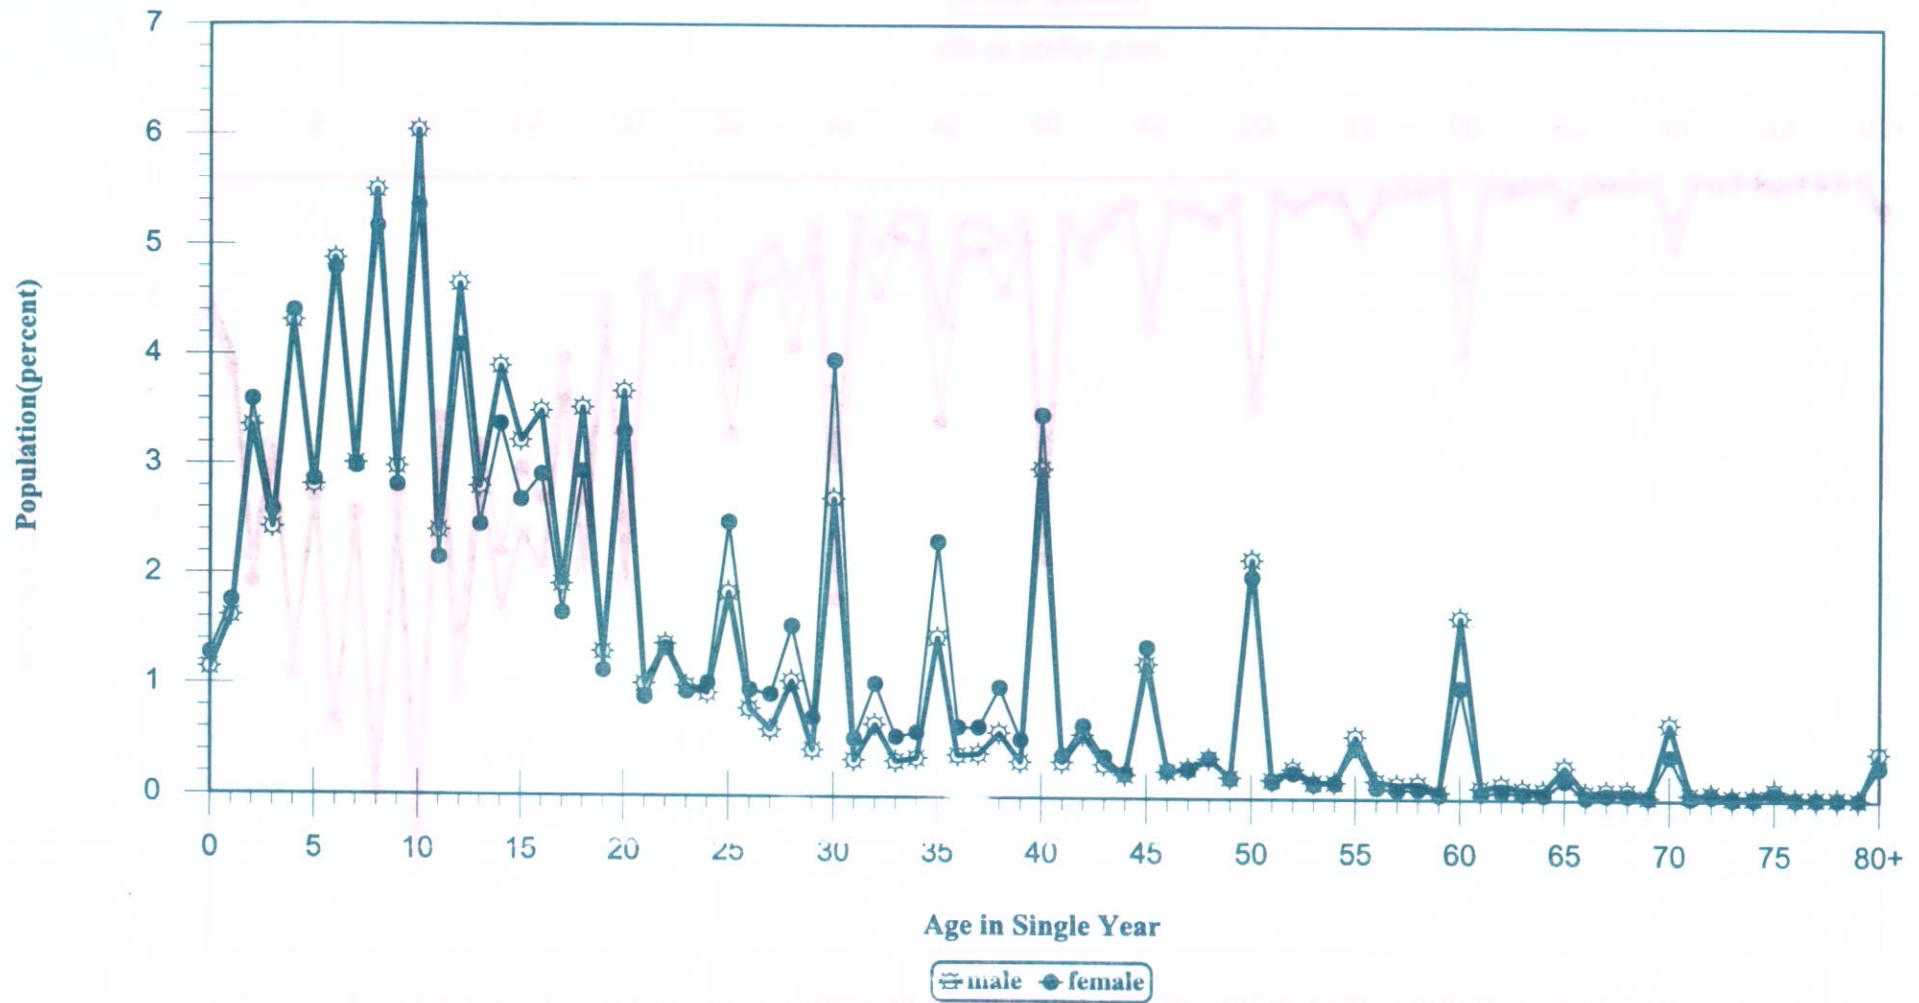

Fig 2-2b Percentage Distribution of Population by Sex and Age in Single Year, Somali Region-Urban: 1997

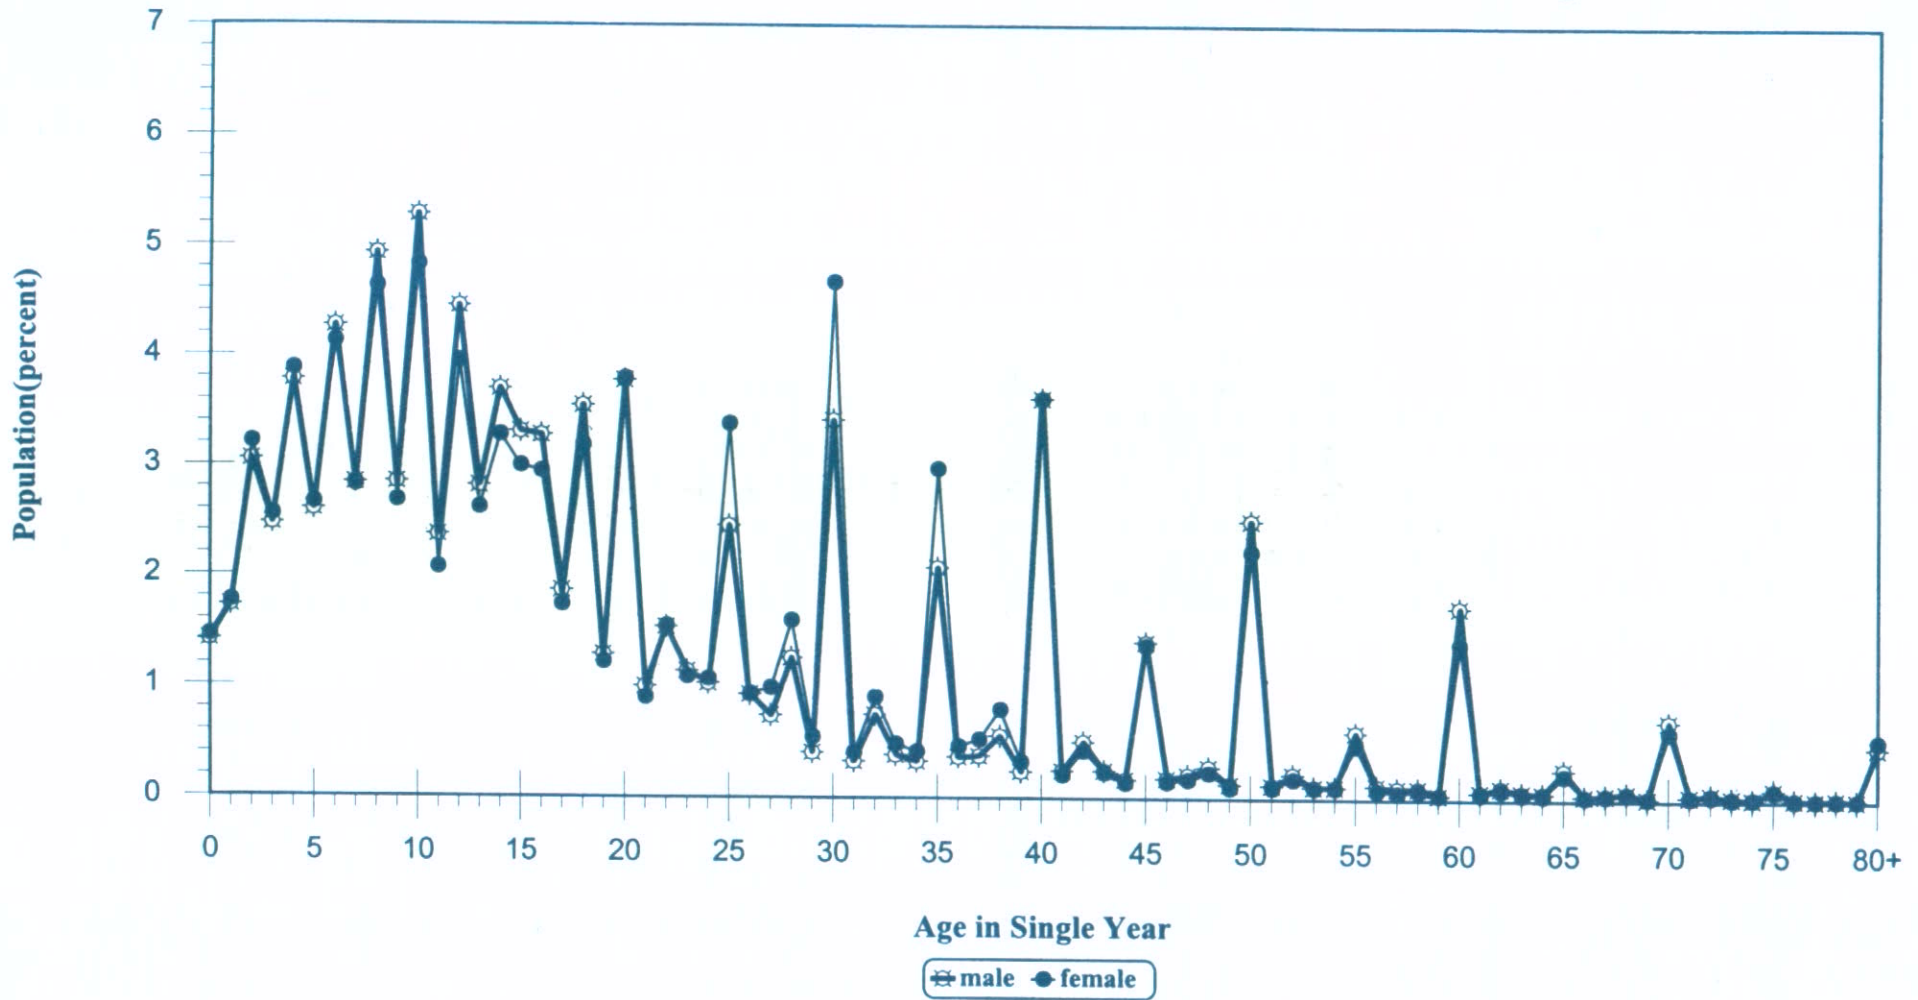

Fig 2-2c Percentage Distribution of Population by Sex and Age in Single Year, Somali Region-Rural: 1997

Myers' Blended Index is usually used to measure degree of preference for each digit and it provides summary index for all terminal digits. The theoretical value of Myers' summary index ranges between 0 and 90; value of 0 represents no age heaping, while value would be 90 if all ages are reported as numbers ending in the same digit. The summary preference indices for Somali Region are found to be 48.2 for both sexes combined, 47.2 for males and 49.3 for females. The corresponding figures for both sexes combined in urban and rural parts of Somali Region are 56.4 and 46.7, respectively. This shows, again, that single year age data of the 1997 census for Somali Region suffered from age heaping, and that the quality is relatively better in rural areas than in urban areas for both males and females.

Regarding which digits are preferred or avoided, the data in Table 2.5 shows a tendency of both males and females to state their ages in digits ending in '0', '5' and '8' and avoiding ages ending in remaining digits (i.e., '1', '2', '3', '4', '6', '7' and '9'). This finding is in line with previous

data sets collected in Ethiopia (CSA, 1991). Put in order of preference, '0' is the highest preferred digit followed by '5' and '8' in that order. On the other hand '1' and '9' are the most avoided digits. The second most avoided digits are '3', '7' and '4' in that order. Digit '2' is the least avoided by both males and females. The result obtained concerning degree of preference/avoidance for the total region is replicated in both urban and rural areas.

b) Differentials in Age Shifting by Sex.

Another problem in age data is age shifting. Age shifting/misreporting can best be studied from the progression of grouped age data. In this section the age pyramid shown above is used once again to examine differentials in age shifting by sex. Mathematical tools such as age ratios, sex ratios, and UN age-sex Accuracy Index were also applied.

The distribution of population by five year age group is given in Tables 2.2a-2.2c and Figures 2.1a-2.1c display the Age-pyramid of Somali Region. Errors in single year age reporting was markedly observed, although in five year age group some improvements have been demonstrated, however, there are still some undulations. This pattern applies both for male and female population.

The age ratio index, sex ratio index and United Nations Age-Sex Accuracy Index (Joint score) are given in Table 2.6. The age ratio index is the mean of the absolute deviation of the age ratios from 100 while the sex ratio index is the mean of the absolute successive difference of the sex ratio in each age group. The joint score is obtained as three times the sex ratio score added to the two age ratios.

Liben	Total	476,881	100.0	476,604	99.94	40	0.01	202	0.04	35	0.01
	Male	260,589	100.0	260,346	99.91	25	0.01	193	0.07	25	0.01
	Female	216,292	100.0	216,258	99.98	15	0.01	9	0.00	10	0.00

The UN Age-Sex Accuracy Index is interpreted as follows. An index of 40 and over is considered as highly inaccurate, while an index of between 20 and 40 is labeled as inaccurate and index of less than 20 is considered as accurate. The UN age-sex accuracy index, which is 134.1 for Somali Region indicates that the age-sex data is in the category of highly inaccurate. The index calculated for urban and rural parts of Somali are 121 and 138.5, respectively, falling in the category of highly inaccurate. As the figures indicate, compared to rural areas, the age data for urban areas seems to be slightly better.

2.4 Household Characteristics

The previous sections have examined characteristics of population in terms of individual characteristics such as age and sex. However, all human activities and behaviors involve participation in group. The most important human grouping is the family or the household. In this section, attempt will be made to study characteristics of households such as type of residence, household size and headship rate.

2.4.1 Type of Residence

Distribution of population by type of residence and zone is presented in Table 2.7. In the census, type of residence is defined in terms of the type of household in which the person is living. Here type of household is categorized into two major groups, namely, conventional and non-conventional. Respondents who live in the same housing unit or in connected premises and have common cooking arrangements (eat their food together) are said to be residing in conventional households. On the other hand, persons residing in non-conventional households are subdivided into residents of collective quarters which include hotel/hostel and other collective quarters) and the homeless. A collective quarter is a housing unit, a building, or a compound in which a number of mainly unrelated persons reside together and share common facilities. Examples of collective quarter include boarding schools, prisons, hotels, hostels,...etc . Homeless persons are those without any fixed residence.

The 1997 Population and Housing Census result reveals that 99.9 percent of the population of Somali Region reside in conventional households, while only 0.1 percent live in non-conventional households (0.04 and 0.06 percent, respectively, are residents of hotels/hostels and other collective quarters) and the proportion of homeless persons is very insignificant.

It would be of interest to look into the age-sex distribution of homeless persons. The distribution of homeless persons by age group and sex is presented in Table 2.8. The 1997 census reveals that the majority of the homeless are adolescents or adult males. Almost 74 percent of the homeless are males and are concentrated in the age group 15-24 (25.7 percent) and 25-49 (30.9 percent). The share of children in the age group 0-9 and 10-14 is 18.4 percent and 15.6 percent of the total homeless persons, respectively. Somali Region had also homeless persons in the older age groups with 5.8 percent and 3.7 percent for 50-64 and 65 and over age groups, respectively. The distribution of population by type of residence for zones is almost similar to that observed for the region.

Table 2.8 Percentage Distribution of Homeless Population by Broad Age Group, Sex, and by Urban and Rural, Somali Region: 1997.

URBAN AND RURAL	ALL AGES		BROAD AGE GROUP					
	No.	%	0-9	10-14	15-24	25-49	50-64	65+

Female	100	100.0	29.00	18.00	24.00	24.00	4.00	1.00

2.4.2 Household Size

Data on the household size and distribution of persons per household can sometimes be used as a proxy measure of crowdedness of a population and has great implication to health and housing problem. The 1997 census results presented in Table 2.9 indicate that, as of September 1997, there were 509,107 conventional households in Somali Region accommodating 3,379,419 persons. Thus, average household size for Somali Region would be 6.6 persons per household. Average Household size in urban and rural parts of Somali are 6.2 and 6.7, respectively.

Regarding the distribution of persons per household, it may be observed from Table 2.9 that single person households comprise 1.83 percent of the total households and accommodate 0.3 percent of the total population. Households with five or fewer members constituted 33.95 percent of the total households and accommodate 19.65 percent of the population.

The distribution of persons per household exhibit different picture in urban and rural areas. Proportion of small size (households with four or fewer persons) households is higher in urban areas while proportion of large size households (five-nine) out number in rural areas.

2.4.3 Headship Rates

The term headship rate denotes the ratio of the number of heads of households by specific categories of the population to total population of the corresponding category. In the census, a head of the household is any member of the household who is recognized as a head by members of the household. The concept of headship rate is an important measure of household formation and hence it is a pivot around which modern method of projecting households and families turns. Headship rate can be calculated specific for age, sex and marital status or other demographic variables. In this sub-section, an attempt is made to examine the pattern of headship rate by age, sex and marital status.

In general, male headship rates are higher than those of females at all ages reflecting the fact that males in most societies assumes the role of chief bread-winner in the household as well as the ones who mainly bear responsibility for family affairs, apart from domestic chores, child-bearing and child rearing. The age-sex differential in headship rate for Somali Region, presented

Table 2.9 Distribution of Households and population by Number of persons per Household, Somali Region: 1997

in Tables 2.10a-2.10c and Figures 2.3a-2.3c, fits to the general expectation. The overall headship rate for Somali Region is 0.222. The overall male headship rate is 0.333 against 0.088 for females. The rate among males is about the same while it is significantly higher in urban than rural areas for females.

Regarding age pattern of headship rate, the data in Tables 2.10a-2.10c and Figures 2.3a-2.3c show that it is low in the young ages and increases with advancing ages of the heads until the highest is reached at about age 55 to 59 years for males. For females in rural areas the peak is at the age group 65+.

2.5 Marital Status

This section will review the level and pattern of marital status of population residing in Somali Region. In countries like Ethiopia, where most of child bearing occur within marriage, and use of modern contraceptive methods is minimal, nuptiality factors are important proximate determinants of fertility. Since family is central to income maintenance, economic status and social adjustment, marriage statistics has economic and social implications. Moreover, information on marital instability may give an insight and help to resolve social problems, such as prostitution and increase in number of street children that are partly the outcome of family dissolution due to divorce and death of one or both of the spouses.

2.5.1 Composition and Trend of Marital Status

The distribution of marital status of the population aged ten years and over by age group and sex is presented in Tables 2.11a-2.11c. In the census, marital status was categorized into four main groups namely: single, married, divorced, and widowed. A person who had never been married is considered as single. Married persons include couples who are living together bonded by any kind of marital engagement at the time of the census (traditional, religious, or civil marriages). Separated couples are also considered as married unless they had dissolved their marriage agreement. A person who had been married but whose marriage was dissolved before the census day is categorized as divorced.

Fig 2.3a Headship Rate by Sex and Age, Somali Region-Urban+Rural: 1997

Fig 2.3b Headship Rate by Sex and Age, Somali Region-Urban: 1997

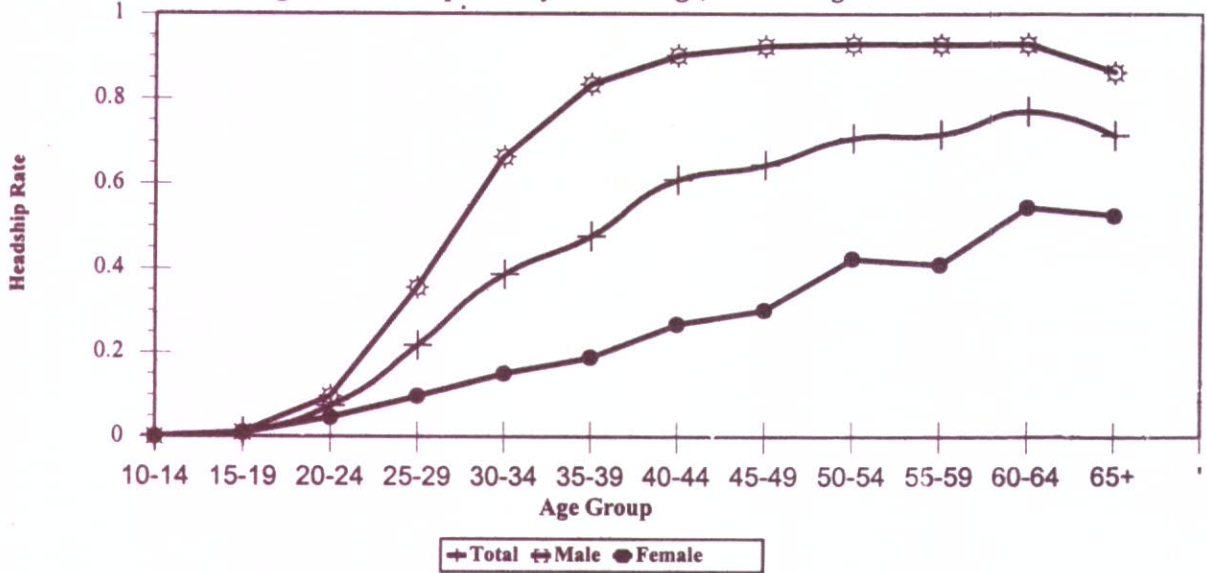

Fig 2.3c Headship Rate by Sex and Age, Somali Region-Rural: 1997

Figures in Tables 2.11a-2.11c revealed that, in 1997 41.4 percent of the region's population aged 10 years and over have been engaged in marriage, 37.1 percent currently married, 1.2 percent divorced, and 3.1 percent widowed). In the region, 65.1 percent of the males and 50.6 percent of the females are single and 33 percent and 42.1 percent are currently married males and females, respectively. Also about 4.3 percent of the population have dissolved their marriage by either divorce or widowhood. The proportion in dissolved marriages is significantly higher among females than males, indicating remarriage to be higher among males than females.

2.5.2 Tempo and Proportion Ultimately Married

The fact that 7.3 percent of the female population at age group 15-19 were ever married, compared to 1.1 percent of males indicates that males enter into marriage late. This fact has also been confirmed by the data on Singulate Mean Age at Marriage (SMAM) which is an indirect estimate of mean age at marriage. It is a measure used to estimate the average number of years lived by a cohort of men or women before their first marriage. SMAM for Somali Region is found to be 26.3 years, that is, an average person in Somali Region stays in single status for about 26 years. Similarly, SMAM for male and female population of Somali Region are 28.8 and 24 years, respectively. That is age at marriage is at least five years in favour of the male. On the other hand, at age group 45-49, there are only 1.6 percent of males and 0.7 percent of females who remained in single status indicating marriage in Somali Region is universal. By age group 25-29 more than 42.4 percent of the males and 78.6 percent of the females have already been engaged in marriage.

2.5.3. Age-Sex Pattern in Marital Status

An examination of age-sex pattern of marital status of the population indicate curvilinear relationship between age and proportion currently married. That is, percent of married population increases as age advances, reaching its maximum value at the age group 45-49 and then begins to decline (see Tables 2.11a-2.11c). Percent currently married persons among males is lower than the corresponding figure for females at young and adolescent ages whereas the reverse order takes place for adult and old age groups, i.e., 40-44 and over. The highest percentage of married males was found in the age group 55-59 whereas the proportion married among females is highest in the 35-39 age group. The pattern for urban and rural areas resemble that of the region. Also, proportion married for urban areas is less than that of rural areas at all ages except at age

group 15-19 years. The fact that percent of currently married among males is lower at young and adolescent ages, and higher at adult and old ages in comparison to females may be explained by the tendency of males to marry females younger than their ages. The higher chance of remarrying among males than females might also be the reason for the higher percent of currently married males in the adult and old ages.

The proportion of single persons decreases with age for both males and females. The proportion single among males is higher than that of females for almost all age groups. For females, proportion single starts to decline at early age group (i.e., 15-19) and continues to do so up to age group 50-54 remaining stable thereafter. Whereas, for males the decline goes on up to 60-64 years age group. The fact that more males than females remain single at age group 15-39 is mostly due to the greater tendency among the males to marry at later age.

2.5.4 Marital Status and Headship Rates.

The data on Table 2.12 presents headship rate by sex and marital status of heads of households. In urban and rural areas the majority of households occupied by married persons (couples) are headed by males. In both urban and rural areas, headship rate for males is substantially higher than that of females. For males, next to currently married, the highest headship rate is registered for widowed followed by divorced and the single. For females the highest rate is among widowed followed by divorced, currently married and single, showing the greater tendency of divorced than widowed to go back to their families/relatives. The difference in headship rate between widowers and divorcees is relatively narrower in urban areas. Headship rate among the widowers and divorced females is higher in the region. These facts may partially support the supposition that many women heads of households are either those whose husbands are working away, or those whose marriages have been dissolved.

2.6 Ethnic Composition.

Ethnic identity of a person is traced through his/her national origin. To assist the enumerators in recording the information, detailed list of the ethnic groups and languages in the country with appropriate codes, was provided in the census enumerator's manual. The list, which was obtained from the then Institute of Nationalities Study, is presented in Annex 2.1 of this chapter.

Distribution of ethnic groups with 500 or more persons by sex is presented in Table 2.13. The result indicates that the Somalie ethnic group constituted the overwhelming majority (95.7 percent) of the population of the region. Oromo comprised 2.3 percent and Amara with 0.7 percent. Each Other Ethnic groups and foreigners, constituted 1.3 percent of the total population of the region.

Ethnic group Somali, Amara, other foreigners and Oromo form the largest four ethnic groups in a given order in size in urban areas. As regards rural areas, the situation has different

picture. Here Oromo stood second next to Somalie. Consistent with that of the total population, males dominate females in number among the Somalie, Oromo, Guragie, Sidama and Tigraway while the opposite is true for the Amara.

Regarding the distribution of ethnic groups by zone, figures in Table 2.14 show that Somalie to be the largest ethnic groups in all zones, followed by Oromo in Shinile, Jigjiga, Afer and Liben zones. About 4 percent other Ethiopian national groups were found to live in Afer zone.

2.7 Language

Language is one of the major socio-cultural characteristics of a population. A person may use a language as a mother tongue or speak it as a second language. In the census, "mother tongue" is defined as the language used by a person for communication with his/her family members or guardians during childhood. Whereas, "second language" is additional language used by the respondents. If the respondent uses more than one additional language, the one used more frequently is recorded. List of Languages spoken in the country was obtained from the then Institute of Nationalities Study and is presented in Annex 2.2 of this chapter.

The population distribution by mother tongue and second language spoken by 500 persons or more is presented in Table 2.15. According to the data on Table 2.15, the overwhelming majority (95.9 percent) of the population use Somaligna language as a mother tongue. Oromigna, used by 2.24 percent of the population, is the second largest language spoken as a mother tongue followed by Amarigna with 0.93 percent. The remaining Ethiopian languages are used by about 0.7 percent of the population. Only 0.2 percent of the population use foreign languages as a mother tongue.

Considering the second language spoken, the figure in Table 2.15 indicate that more than 91.7 percent of the population did not have second language. Oromigna is spoken by the highest proportion (4.26 percent) of the population as second language, followed by Somaligna with 1.6 percent. The remaining Ethiopian languages are spoken as a second language by only 2.4 percent of the population. Also 0.5 percent of the population of Somali Region speak foreign languages as a second language while 0.2 percent did not report their second language. In summary, about

97.5 percent of the population speak Somaligna either as a mother tongue or as a second language. The corresponding figure for Oromigna language is 6.5 percent.

Attempt was made to study the relationship between mother tongue and ethnic group on the one hand and ethnic group and second language on the other. Tables 2.16 and 2.17, respectively, present the distribution of mother tongues by major ethnic group and the distribution of second languages by major ethnic group. Also, the distribution of second language by major mother tongues is presented in Table 2.18.

It is generally expected that household members use the language or dialect of their own ethnic group for communication during childhood. According to the data in Table 2.16, the above supposition holds true for most of the ethnic groups in Somali Region. It can be said that all the major ethnic groups, presented use the language of their own ethnic group dominantly. The proportion using the language of own ethnic group varies from 100 percent among Guragies and Sidama to 67.8 percent among Tigraway.

Examining the data in Table 2.17 indicate that most of the ethnic groups in Somali Region are multi-lingual. More than 50 percent of members of 4 ethnic groups speak additional dialects of their own. To mention them, Amara, Hadiya, Harari and Tigraway with 46.5 percent, 22.7 percent, 18.5 percent and 13.3 percent of their population speak no second language. The Tigraway are found to be the most multi-lingual ethnic group with 59.5 percent of the population speaking Amarigna, 17.9 percent Other ETH. languages and 4.9 percent Somaligna. Multi-lingual ethnic groups next to Tigraway are the Hararis, Hadiya, and Amara in that order.

2.8 Religion

Religion is another important socio-cultural characteristics of a population. It is an affiliation with a group having specific religious or spiritual tenet. In the census every member of the household was asked about his/her religious affiliation and classified as one of the following: Orthodox Christian (including the Kibat and Tsega); Protestant Christian (including Seven Day Adventist, Pentecost, Lutheran, Baptist, Anglican, Presbyterian, Meserete Kirstos, Mulu Wengel, Kale Hiywot; etc.); Catholic Christian; Muslim or follower of Traditional religion. Followers of religions other than the above mentioned ones are categorized in the 'others' group. Table 2.19 show the classification of the population of Somali Region by sex and religion.

Note:- ETH= Ethiopian, Forgn.=Foreign.

According to the census result, the overwhelming majority (98.7 percent) of residents of Somali Region are Muslims. Next to Muslims are Orthodox Christians with 0.9 percent. Protestants comprise 0.1 percent of the total population of the region, respectively. Followers of Catholics and Other religions are also negligible. The religious composition of population in rural area resembles that of the region. In urban areas, however, the proportion of Muslims decreased to 93.5 percent, while Orthodox Christians increased to 5.8 percent of the total.

Examination of the data of religious compositions by ethnic groups reveals considerable variation among them (see Table 2.20). The overwhelming majority (more than 90 percent) of Somalis, Oromo and Sidama are Muslim. The Tigraway, Amara and Guragie population were dominantly affiliated with Orthodox Christian.

The data on Table 2.21 show modest variation in religious composition of the residents by zone. Muslims reside in all the zones with a proportion varying from 23.6 percent in Jigjiga Zone to 6.5 percent in Fiq Zone. The proportion of Orthodox Christians ranges from 69.8 percent in Jigjiga to 0.0 percent in Fiq Zone. The share of Catholics and Protestant constitute 0.1 percent of the total population. All traditional belief followers of the region live in Fiq zone.

2.9 Disability Status and Type

In the census data on disability status and type of disability were collected on sample of households. Thus, distribution of population by disability status and type of disability by broad age group and sex is given in Table 2.22. In the census a person was defined as disabled if due to physical or mental injuries, could not fully perform activities that other healthy persons could do. It represents decrease or loss of ability to discharge various social or economic functions. In the census disability was classified into 10 categories. As given in Table 2.22 the data shows that there were 34,156 disabled persons (i.e., 1 percent of the total population excluding the homeless) of Somali Region with sex ratio of 127 males per 100 females. Of the total disabled persons, 25.9 percent are in the age group 0-14, 48.9 percent are in the age group 15-49, and about 25.2 percent are in the age group 50 and over.

Among the major disability types are leg problem affecting 31.8 percent, partial blindness affecting 15.4, and Hand/Arm problem affecting 14.9 percent of the disabled population. Totally blind, hearing and speaking problem, hearing problem and mental problem, are at the intermediate positions with 11.6 percent, 7.5 percent, 6.6 percent and 6.3 percent, respectively. At the bottom of the spectrum was leprosy affecting 0.8 percent of the total disabled population. About 1.9 percent and 3.2 percent of the disabled population are affected by multiple types of disability and other types of disability, respectively. Moreover, Table 2.22 shows disability by broad age group and sex ratio.

3.2 School Attendance and Enrollment

Members of household aged 5 years and over in the sampled household were asked on status of school attendance i.e. attending now, attended in the past and never attended. Accordingly the data on school attendance is presented in Table 3.1.

It can be seen from the table that school attendance in Somali Region both in the past and during the census enumeration is very low, each 4.1 percent . The table shows that 91.3 percent of the population of Somali had no formal education. In both urban and rural areas and in all zones also the majority of the population never attended formal education. The current and past school attendance are relatively higher in urban areas compared to rural areas. About 15.2 percent of the urban population were reported to have been attending school at the time of the census and 12.2 percent were reported to have had formal education in the past. Of the urban population 71.7 percent never attended formal education so far. In the rural areas, 94.6 percent of the population never attended any formal education, 2.7 percent had "attended school in the past" and 2.2 percent "were attending school at the time of the census". The data in the table also show that school attendance during the census enumeration and in the past is higher for boys compared to girls. This is also true for almost all zones.

3.2.1 Enrollment by Single Age

In Somali region, 38.9 percent of the total enrollment takes place in non-regular institutions. Although data classified by type of institution is available, analysis of enrollment by single age strictly is limited to data on all formal learning institutions. Pictorial presentation is also used to display the level of enrollment in regular schools with respect to all formal learning institutions (see Fig 3.1).

The percentage distribution of the population aged 5 years and over who were attending school at the time of the census classified by single age is presented in Table 3.2. The table reveals that enrollment increases and reaches its peak (7.7 percent) at the age of 13 years and thereafter it fluctuates till age 19 years where it reaches 8.6 percent. Beyond that age also it fluctuates. This pattern is observed for males and in rural areas. Although commencing age of

education by the regulation of the country is age 7, enrollment prior to age 7 is apparent from the table. The data in the table reveals that the level of participation at age 7 is only 3.2 percent. This shows that still about 97 percent of the children happened to be out of the school system. In urban areas, nevertheless, enrollment at age 7 suggests that those who were attending school constituted 10.0 percent. As far as enrollment by sex is concerned, in general, slightly higher enrollment for males than for females is observed in almost all ages (Fig 3.2). The difference between males and females enrollment is found to be more pronounced as age advances (see Fig 3.2 also).

3.2.2 Enrollment Ratios

a) Gross Enrollment Ratio

The gross enrollment ratio (Age specific Enrollment Ratio) is defined as a ratio between the number of pupils/students enrolled at a given level of education, regardless of age, and the size of population in the relevant or eligible age group usually expressed in percent. The gross enrollment ratio for both urban and rural areas and all levels of school is calculated and presented in Table 3.3.

The table presents that 7 pupils per 100 population aged 7-12 who are enrolled in primary schools. This ratio is observed to be lower than rates for some least developed African countries such as Mali (24 percent), Niger (29 percent) and Sudan (50 percent) for 1990 (UNESCO, 1993). About 4 pupils per 100 population aged 13-14 and about 2 pupils per 100 population aged 15-18 are enrolled in junior secondary and senior secondary schools; respectively (see Fig 3.3). In order to be able to compare the rates with some developing African countries the gross enrollment ratio for secondary level¹ in general is computed to be 2.5 percent. This ratio is also lower compared to the observed ratio for some Sub-Saharan African Countries such as Mali, Niger (each 7 percent) and the Sudan (22 percent) for 1990 (UNESCO, 1993).

In urban areas, however, relatively higher ratios, i.e. about 37 percent for primary, 23 percent for junior secondary and 12 percent for senior secondary levels are observed. Enrollment ratio at zone level is also very low. The highest enrollment ratio which is 11.8 percent for primary level 7.7 percent for junior high school level and 5.5 percent for senior secondary level is recorded for Jigjiga Zone.

¹The quotient of total pupils in junior and senior secondary by population aged 13-14 and 15-18, respectively.

It is believed that the availability of schools in urban areas is better than in rural areas. This creates better opportunity for schooling of children of urban dwellers to a higher degree than their counterparts in rural areas. As a result enrollment ratios for urban areas are observed to exceed that of the rural in all the levels. The enrollment ratios are 36.5 against 2.5 percent for primary, 22.8 percent as opposed to 0.4 percent for junior secondary and 12.1 percent verses 0.1 percent for senior secondary. Similar pattern is observed for all zones.

The table also reveals that male participation is relatively higher than female in all levels. Similar pattern is observed for both urban and rural areas and for almost all zones.

The gross enrollment ratio does not allow for matching of eligible age groups with corresponding levels of schooling. In order to overcome this limitation the net enrollment ratio is employed in the following sub-section.

b) Net Enrollment Ratio

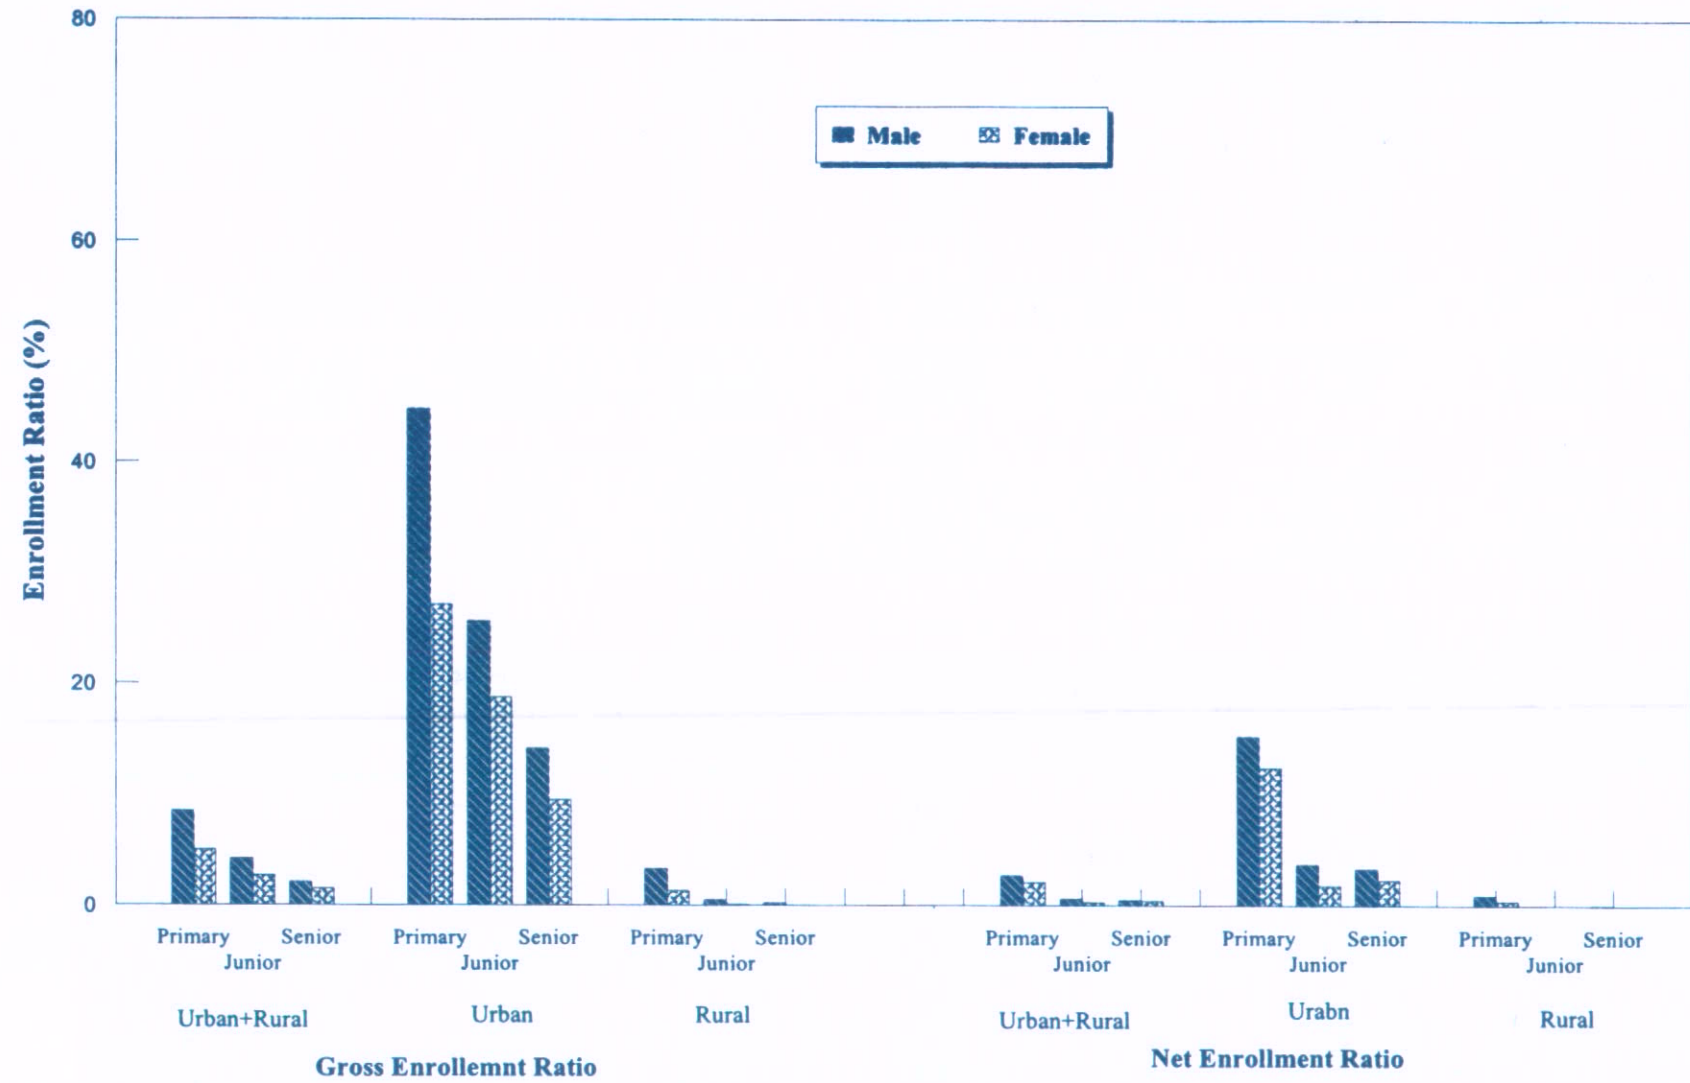

The net enrollment ratio is defined as the ratio between the number of pupils of eligible age into a particular level by the population of the corresponding age group and is usually defined in percent. In other words, the net enrollment ratio for primary level is the ratio of children aged 7-12 and are in primary level to the total number of children in age group 7-12. Similarly the net enrollment ratio for junior secondary level is defined as the ratio of children aged 13-14 and are in junior secondary level to the total number of children in age group 13-14. This ratio in senior secondary level is obtained by dividing number of children aged 15-18 and are in senior secondary level to the total number of children in age group 15-18. The net enrollment ratio for different levels is calculated and is presented in Table 3.4.

The table reveals that the net enrollment ratio for primary, junior secondary and senior secondary levels are very low, 2.5 percent, 0.4 percent, and 0.5 percent, respectively. These results are interpreted as among 100 children aged 7-12, about 19 of them were attending primary education during the census enumeration. By the same token, among 100 children aged 13-14 and 15-18 about 4 and 5 were attending in junior secondary and senior secondary levels, respectively.

Fig. 3.3 Gross and Net Enrollment Ratios of Primary, Junior Sec. and Senior Secondary Levels by Sex, Urban and Rural, Somali Region: 1997

As far as net enrollment ratios for zones are concerned best ratio for primary (4.1 percent), (1.2 percent) and for senior secondary (1.5 percent) is recorded in Jijjiga Zone.

The data in table also indicate relatively higher ratio for boys than girls in each level. This holds true for both urban and rural areas.

The net enrollment ratios for urban areas are observed to be very high compared to rural. The results are 13.9 percent for primary, 2.9 percent for junior secondary and 2.8 percent for senior secondary, in urban areas. The corresponding figures for the rural areas are 0.7 percent for primary. No pupil whose age is in the appropriate age group for junior secondary and senior secondary is found in rural areas. In urban areas the participation of boys is relatively higher compared to girls, 15.2 percent against 12.4 percent in primary schools.

c) School Progression

This section presents data on age and grade distribution of currently enrolled students. The classification of students by single year age and grade would throw some light on the grade progression of students in the school system. According to the existing school system of the country at the time of 1994 census, the length of years of schooling in primary level is six years, in junior secondary it is two years and in senior secondary it is four years. The onset age of formal schooling in the country is set to be seven years though there are pupils who commence before and after this age.

Tables 3.5(a) - 3.5(c) present numerical distribution of students by single year age and grade for the total, urban and rural areas, respectively. Assuming a student advances a grade each year and considering the age at which students start formal schooling, the data shows how students progress in the school system. The tables indicate the actual number of students who can be considered as being progressed normally, scholastically retarded and/or accelerated.

A student is scholastically retarded if the grade in which he/she is enrolled is below the grade which is normally expected for his/her age. On the other hand, a student is scholastically accelerated if the grade in which he/she is enrolled is above the grade which is normally expected

for his/her age (shryock & et.al. 1976). Hence, one could extend the definition to consider a student as progressing normally if he/she enrolls in a grade that is appropriate for his/her age.

3.3. Educational Attainment

The general level and size of the population that are very much essential in development planning can be assessed using the educational attainment data. Educational attainment is defined as the highest grade completed within the most advanced level attended in the educational system of the country, where the education was received. For this purpose, a grade is defined as a stage of instruction usually covered in the course of the school year.

The census questionnaire included data on educational attainment. Irrespective of the educational status that a respondent might have had, every person aged 5 years and over was solicited to state whether he/she was literate or not. If literate, respondents were further inquired to report the highest grade completed in the formal education system. Following the recommendation of the United Nations that states age of 10 years as the minimum age for compiling and analyzing data on educational attainment. The educational attainment of the population classified by sex, age, ethnic group, religion and grade are discussed below.

3.3.1 Literacy Status by Zone, Urban and Rural Areas

Table 3.6 reveals that only 8.1 percent of the population of the Somali Region stated that they are literate. This rate is lower compared to the rates in some of the developing countries such as Mali (32 percent), Chad (29.8 percent) and the Sudan (27.1 percent) for 1990 (UNESCO, 1993). Among the urban dwellers of Somali Region 28.0 percent stated that they are literate. The corresponding figure for the rural areas is 4.6 percent. This suggests that the literacy rate in the region is very low. The fact that relatively significant proportion of the population in urban areas have reported to be literate could be attributed to the relatively better school facility available in the urban areas, the influx of literate population from rural to urban areas searching for jobs and other better opportunity. The table also shows that relatively more males than females are found to be literate in both urban and rural areas. For instance, 36.1 percent, 6.7 percent and 10.9 percent of the males in urban, rural and the region as a whole have reported to be literate while the corresponding figures for females are 18.9 percent, 2.1 percent and 4.7 percent, respectively.

Rural	10.07	14.87	4.29	89.83	84.94	95.71	0.10	0.18	0.00

Literacy rate among the zones ranged from 11.9 percent for Liben Zone to 2.1 percent for FiQ Zone. Literacy rate is higher in urban than in rural areas and for males than females in all zones.

3.3.2. Educational Attainment by Grade

The literate population are further classified by grade. The percentage distribution is given in Table 3.7. The table indicates that out of the total literate population the highest proportion (44.4 percent) have completed grades in primary schools followed by 29.5 percent of the population who have attended non-regular education (level of education could not be expressed in the regular school system). Population who have completed senior secondary, junior secondary and above secondary education accounted for 13.9 percent, 11.0 percent and 1.2 percent of the total literate population of the region, respectively. In urban areas most (51.4 percent) of the literate population have completed grades 1-6. followed by those who have completed grades in senior-secondary (21.9 percent) and junior secondary (15.3 percent). Literate population whose education described as 'non-regular' and above secondary education formed 9.5 percent and 2.0 percent, respectively. In rural areas half (51.0 percent) of the population have attended non-regular education only and 36.9 percent have completed grades in primary level. Those who completed grades in junior secondary, senior secondary and above secondary accounted for 6.5 percent, 5.4 percent and 0.3 percent, respectively.

In shinle, Degehabur and FiQ Zones, the majority of literate population, more than half, have been reported to have completed grades in primary level. On the other hand, in Liben and Afder Zones the majority of the literates have attended only non regular education.

3.3.3. Educational Attainment by Age

An attempt was made to examine the distribution of population aged ten years and over classified by age group and highest grade completed. The percentage distribution is given in Tables 3.8(a)-3.8(c).

The data in the tables show that the proportion of literate population gradually increases up to age 25 years and thereafter it fluctuates. This pattern holds true for females and the urban

areas. In rural areas, however, literacy attains its highest values (about 6 percent) in the age groups 15-29, the proportion shows an irregular pattern with advancing ages. In all age groups higher proportion of male literate population than female is observed and the difference is more glaring as age increases.

The tables also display that the proportion of literate population who attended non-regular education strictly increases beyond age 40 years. In all age groups, except in 35-49 and 50-54, slightly higher proportion for males than for females is observed for this category. In these exceptional age groups proportion of literate female who attained non-regular education exceed their male counterparts. Moreover in all age groups except in 15-29 years and 55 and above the proportion of literate male who completed grades in primary level is lower than their female counterparts.

3.3.4. Educational Attainment by Ethnicity

Table 3.9 presents data classified by highest grade completed and major ethnic groups. The table reveals that illiteracy is relatively more among the Somalis (about 93.1 percent) followed by the Oromos (84.4 percent) out of their respective total population. The table also indicates that most of the Oromos (46.9 percent) and Somalies (44.9 percent) out of their respective total literate population in Somali region have completed grades 1-6. Among the Amhara literate population 45 .0 percent of them have attended grades in senior secondary school.

3.3.5. Educational Attainment by Religion

The distribution of the population aged ten years and over by religion and highest grade completed is presented in Table 3.10. The table displays that only 7.3 percent of the Muslims are literate while out of total Christians 69.0 percent are literate. The literacy status among the different denominations of the Christians out of their respective total population indicates that the majority, 70.1 percent and 51.9 percent of followers of the Catholic and Protestant faith, respectively, can not read and write. Among the Orthodox Christians only 24.7 percent are illiterate. The distribution of the literate population of the Christians by highest grades completed display that the first and second highest are in senior secondary and primary followed by junior

secondary, above secondary and those who had non-regular education. This distribution of literate Muslims, by highest grade completed however, portrays similar pattern with the distribution observed for the Somali Region where most of the literate population completed primary level, followed by non-regular school, senior secondary, junior secondary and above secondary education, respectively.

3.3.6. Median Grade Completed

The median grade completed by the literate population aged 10 years and above has been calculated for urban , rural and for the region by sex and presented in Table 3.11. In estimating median grade for the population who are literate, those whose level of education could not be expressed in the regular school system (non-regular) are excluded from the calculation because their equivalent grade in the regular school system is not known.

Table 3.11 Median Grade Completed by Sex, Urban and Rural, Somali Region: 1997

SEX	Urban+Rural	Urban	Rural
Total	0.5	0.7	0.5
Male	0.5	0.8	0.5
Female	0.5	0.6	0.5

Table 3.11 shows that the median grades completed by the literate population of Somali Region for each sex were grades 0.5. This value for the urban literate population is estimated to be 0.7. It can also be seen from the table that in urban areas median grades for males (0.8) is higher than for females (0.6). Since the level of educational attainment in the rural areas is very low, the median grades completed by either of the sexes is extremely low which is only 0.5.

CHAPTER IV

ECONOMIC ACTIVITY STATUS

4.1 Introduction

In the 1994 Population and Housing Census, the information collected on economic activity status include:

- a) whether engaged in productive work during the reference period;
- b) reason for not being engaged in productive work during the reference period (for those who were not so engaged);
- c) major type of occupation;
- d) major product or service of the establishment or industry;
- e) employment status in the main activity;
- f) number of days worked during the seven days prior to the census day for those engaged in productive work (for urban areas only).

The above information on economic activity status was collected from sample households.. The economic activity questions refer to those members of households aged ten years and over. The minimum age was fixed at ten because it is presumed that most children start to participate in the production of economic goods and services at **young** ages, particularly in the rural areas.

Based on the above data set, the chapter will present major analytical **outputs** on the economically active and inactive population and the distribution of the economically active population by type of occupation, industrial division and status in employment. **In addition, a brief description on concepts and measurements of major economic variables are included.** However, those who need more tabulations on some economic variables and **geographical break down** should refer to Volume I of the Statistical Report of the 1994 Population and Housing Census of Ethiopia results of Somali Region (CSA, 1998).

The approaches used in the collection of data on economic activity status in the urban and rural areas were different. The current status approach was employed in the urban areas, while the usual status approach was used in the rural areas. The main difference between the two approaches is in the length of the reference periods. The current status approach is based on a short reference period, which in this case is the seven days before the census day. On the other hand, the usual status approach measures in relation to a long reference period, that is, the twelve months before the census day.

Basically, the conventional way of collecting economic activity status data in the urban and rural areas is to use the two approaches in each of the areas or to limit the method to one type of approach, so that comparative analysis would easily be facilitated. However, due to a number of reasons, such as, limitation of space in the census questionnaires, time constraint in the data collection process and the problem in handling the editing and processing of the data, incorporating the two approaches in the urban and rural area questionnaires was not possible. On the other hand, it was found difficult to use a common approach in the urban and rural areas, because of the different nature of the economic activities in the two areas. Thus, in the rural areas, among other factors; to capture the slack periods in the agricultural activities, a longer reference period (usual status approach) was considered appropriate, while in the urban areas the activities are relatively less affected by seasonal variations and hence a shorter reference period or the current status approach was employed. Therefore, caution should be taken in applying the results of the comparative analysis part for some of the economic activity status variables by urban and rural residence.

Economic activity in the census was defined in terms of production of goods and services that fall within the United Nations System of National Accounts (SNA) production boundary (ILO, 1990a). Hence, in the 1994 Population and Housing Census economic activity is defined as work which involves the production of goods and/or services for sale or production of certain products for own consumption. According to the above general definition, all economic goods and services produced for sale were considered as economic activity, however certain activities for own consumption or own use are also considered as economic activities. These include production and processing of primary products

(agriculture, hunting, fishing, forestry and logging, and mining and quarrying), processing of primary products by the producers themselves, production of other commodities where part of it is sold on the market; and own account construction and fixed asset formation (expected life use of one year or more). Such economic activities could be performed for an individual, family or private enterprise, government establishment or public organization. The remuneration may be on daily, weekly, monthly, yearly or contract basis. The activities of apprentices are also considered as economic. On the other hand, unpaid household chores such as preparing food, cleaning the house, taking care of children or collecting firewood are not considered as economic activities. Similarly, unpaid community and volunteer services and prostitution are classified as non-economic activities.

In urban areas all persons aged ten years and over who were productively engaged for at least one day or were available to be engaged during the seven days reference period were included as economically active persons. Whereas in the rural areas all persons aged ten years and over were classified to be economically active if they were engaged or available to be engaged in the production of economic goods and services during most of the twelve months prior to the census day. In the case of persons engaged in agriculture, it was decided to classify them in the economically active category if they have worked or were available for work during most of the main agricultural season of the reference year.

4.2 Economically Active and Inactive Population

Statistical data on the economically active population is essential for planning and formulating policies on the development of the human resources of a country. The collection of data on the economically active population mainly provides data on the size of the work force engaged or available to be engaged in the production of economic goods and services during a given period and also its distribution in the various sectors of the economy.

The economically active population comprises all persons aged ten years and over who were employed or unemployed in the reference period. The employed population consists of those who were engaged in productive activity for at least one day during the seven days prior to the census day for urban areas and in most of the twelve months prior to

the census day for rural areas. Persons who had regular jobs but did not work during the reference period because of poor health, social reason, seasonality of work, annual leave or due to temporary closure of establishment were included as employed persons. On the other hand, the unemployed population consists of those who were not working during the reference period and were actively looking for work or were discouraged job seekers. The discouraged job seekers are those who were not actively looking for work but were ready and willing to take up a job if one was available. A person who is looking for work but was temporarily engaged in a productive activity during the reference period is recorded as employed and not as an unemployed person. On the other hand, those who were neither employed nor unemployed during the reference period, following the definitions given above for employed and unemployed persons, were categorized to be economically inactive population. The reasons for being inactive in the reference period were classified in the census as: students, homemakers, disabled, too young, pensioners, prostitutes and others. However, students, pensioners, the disabled, ... etc., will be considered as economically active if they were productively engaged during the reference period. Similarly, prostitutes who were partly engaged in productive activities during the reference period, such as preparing and selling of drinks or serving as waitresses in hotels, bars and restaurants, ...etc., are considered as economically active persons and not as inactive persons engaged in prostitution.

4.2.1 Sizes of the Economically Active and Inactive Population

Based on the above concepts and definitions of economic activity status, the results for Somali Region is presented as follows. The population of the region aged ten years and over was found to be 2,296,750 persons in September 1997 among which, 345,455 were residing in the urban areas, while the great majority of the population 1,951,295 were rural residents (See Tables 4.1a - 4.1c).

Among the population aged ten years and over 1,600,337 or 69.7 percent were reported to be economically active and 678,310 or 29.5 percent economically inactive (See Table 4.1a). The distribution of the economically active population by sex showed that among the male population aged ten years and over, 82.8 percent were economically active,

while in the case of females it was 53.9 percent. The percentage distribution of the economically active population by sex in the nine zones showed the highest for males (86.5 percent) and for females (67.4 percent) in Fiq and Korahe zones, respectively and the lowest for males (80.1 percent) and for females (38.5 percent) in Shinile and Jigiga Zones, in that order.

The tables also revealed that in all the nine zones the percent economically active males were relatively higher than the females. This is true mainly because housewives are mostly engaged in activities that are not considered economic. It may be observed from the data that in the rural areas of Somali Region more active persons were reported compared to the inactive, for both males and females (See Table 4.1c). However, considering the urban part, the balance between the active and inactive females was reversed, where more inactive females were reported than the active (37.8 percent active against 61.8 percent inactive). This could happen because, unlike the rural areas, where the housewives are usually engaged in some form of agricultural activities during the year, in the urban areas, unless they have some type of regular job, most housewives stay at home and are mainly engaged in housework activities. Similar pattern as indicated above was observed in most of the zones (for the Somali Region), where among the zones the lowest percent active females and highest percent inactive females were observed in Jigiga Zone, 38.5 percent and 60.3 percent, respectively.

4.2.2 Economic Activity Rates

The extent of the participation of the population in economic activity is measured using the economic activity rate or economic participation rate. The economic activity rate or the participation rate is computed as the percentage of the economically active population over the total of the active plus the inactive population. Table 4.2 provides the economic activity rates by five years age group, sex, urban and rural residence. The activity rate for Somali Region was reported to be 70.2 percent, 51.6 percent and 73.5 percent, for total, urban and rural areas, respectively. The table also revealed that in all age groups, except in the age group 45-49 years, the activity rates for the rural areas were higher than the urban. Specifically in the age group 10-14 years, the difference was much more wider, where the activity rate was 21.5 percent in urban areas and 64.0 percent in the rural areas. The major

* Activity rates were calculated excluding " the activity not stated population ".

reason for such variation is that in the rural areas young children rather than going to school at an early age, were usually engage in farm activities such as herding cattle and helping parents in weeding and harvesting. On the other hand, in urban areas young children start schooling relatively at an early age and as a result the activity rate is lower.

The distribution of the economic activity rate by age for both males and females showed lower levels at young and old ages while at the middle ages the rate attains its highest level (refer to Figures 4.1a - 4.1c). The census result showed that the overall activity rate for females reach its peak at an early age (15-19 age group), compared to that of males (55-59 age group). In the rural areas the rate of participation drop gently at older ages because of high rate of engagement in farm activities by old people.

4.2.3 Employed and Unemployed Population

Among the economically active population of Somali Region, the employed and unemployed were reported to be 94.7 percent and 5.3 percent, respectively (See Table 4.3). Similar patterns were observed for males (94.7 percent employed against 5.3 percent unemployed) and for females (94.6 percent employed against 5.4 percent unemployed). The above pattern holds true for all nine zones, in the Region. However, in the urban and rural areas of Somali Region a difference in rate was observed, where a very small number of unemployed persons were reported in the rural areas compared to the urban areas (31.9 percent urban unemployed against 2.0 percent rural unemployed). Among the unemployed population, those without work experience or first time job seekers constituted the majority (88 percent), while the unemployed with work experience were reported to be 12 percent. The percentage unemployed female were consistently higher than the unemployed males. This could be because of the fact that more females than males were engaged in non-income generating activities, which resulted in a higher female unemployment rate compared to male.

4.3 Reasons for Being Economically Inactive

The distribution of the economically inactive population by reasons for not being engaged in economic activity in the reference period showed homemakers to constitute the highest proportion (52.6 percent), followed by the too young to work (25.9 percent) and the students (10.7 percent), for total Somali Region (See Table 4.4). The corresponding distribution for females revealed homemakers that constituted the highest (70.1 percent), followed by the too young to work (16.9 percent) and the students (4.7 percent). While in the case of males, too young to work constituted the largest share (about 46 percent), and the students (24.5 percent) took the second largest group, followed by the home makers (12.5 percent). In the urban areas of Somali Region students constituted the highest proportion of the inactive population for males (47.2 percent) and homemakers for females (57.4 percent). Considering the rural part, about 53 percent of the inactive males were found to be too young to work, followed by the home makers (15.2 percent), while among the females, 73.6 percent were homemakers, followed by the too young to work (16.6 percent). In all the zones in the Region, homemakers comprised the highest proportion among the female inactive persons and the too young to work among the males.

Table 4.5a that refers to the distribution of the economically inactive persons by level of education revealed that about 45 percent of the students have completed grades 1-6. It was also reported that about 31 percent of the students were illiterate, even though, they have been attending school during the census. This happens because these students were attending school at the lower level of education, where they have not attained the ability to read and write to be considered literate. In the remaining categories of reasons for being inactive, that is, the disabled, the pensioners and the too young to work, the proportion illiterates were found to be dominant, about 94.5 percent, 94.5 percent and 97.6 percent illiterates, respectively. The corresponding figures for the homemakers and prostitutes were 95.4 percent and 23.7 percent, respectively. Similar distribution patterns as indicated above were observed in the urban and rural areas, however, the proportion illiterates were relatively lower in all the inactive categories of the urban areas compared to the rural areas (See Tables 4.5b - 4.5c). As a general feature, the percent inactive persons were observed diminishing as the level of education increases in both the urban and rural parts of the region.

4.4 Type of Activity

Employed persons were asked about the type of occupation, major product or industrial division of the establishment in which they were engaged during the reference period and the status of their employment in the main activity. These were also collected from unemployed persons who had previous work experience. The information collected from these persons referred to the job they held before they became unemployed. The information on type of activity was not collected from unemployed persons with no previous work experience. Therefore, analysis of the economically active population by **occupation**, major product or type of industry of their establishment and status in **employment** will be based on a number fewer than the total economically active persons by the **number of the unemployed persons** who never had any work experience.

A national occupation and industrial classification code lists were prepared for the census. These lists were prepared closely following the International Standard Classification of Occupation (ILO, 1990b) and the International Standard Industrial Classification (UN, 1990) but took into account the prevailing socio-economic conditions of the country. These classifications were used for coding the responses on occupation and the type of industrial division of the establishment.

4.4.1 Status in Employment

In Somali Region, about 59 percent of the economically active population were unpaid family workers and 32.6 percent self-employed (See Table 4.6). The major contributors for the self employed category were males, while for the unpaid family workers females, 37.8 percent and 69.9 percent, respectively. In the urban areas of the region, the self-employed category comprised the highest proportion of male and female employed population, 45.1 percent and 39 percent respectively. On the other hand, in the rural areas, the unpaid family workers comprised the highest proportion of employed population for females and males, 73.2 percent and 54.9 percent, respectively. Comparatively a high

proportion of government and private employees were reported, 9.8 percent and 6.1 percent, in the urban areas compared to the rural areas, 0.3 percent and 0.9 percent, in that order. The table also revealed that the proportion of employers and members of co-operatives were lower in urban and rural areas of the region. The general pattern described above for the total, urban and rural Somali Region were reflected in most of the zones (See Table 4.6).

4.4.2 Type of Occupation

a) Occupational Distribution

As is well known, the country's rural economy is predominantly agrarian, where the majority (63.5 percent) of the economically active persons in the rural areas of the region were skilled agricultural and fishery workers (See Table 4.7). This was reflected for the total region where about 60 percent of the economically active population were skilled agricultural workers. However, in the urban part the picture is different, where a significant number of the economically active persons were reported in the service workers and shop and market sales workers group (36.5 percent) and those engaged in agricultural activities (22.4 percent). The pattern observed above was also true for males and females in both the urban and rural areas. In general the economically active persons who were engaged in the white collar occupations were considerably small, where a total of 0.8 percent were reported in legislators, senior officials and managers group, professionals group and technicians and clerks occupational group. The major contributor for this value is the urban sector that was reported to have about 9.8 percent of the active persons.

b) Occupation and Level of Education

Tables 4.8a - 4.8c present the distribution of the economically active population by major occupation and level of education for total, urban and rural population of Somali Region, respectively. About 94 percent of the economically active population of the region were found to be illiterate. Except in the white-collar occupations, the high level of illiteracy that prevailed among the economically active population of the region was also reflected in the other occupational groups. For example, the overwhelming majority of the skilled

agricultural and fishery workers and those engaged in elementary occupations were illiterate, 94.9 percent and 96.4 percent, respectively. The corresponding figures for the service workers and shop and market sales workers group and crafts and related trade workers group were, 76 percent and 86.7 percent, respectively.

On the other hand, a significant number of persons who have completed at least grade twelve were reported in the legislators, senior officials and managers group (50.9 percent), professionals group (71.3 percent), technicians and associate professionals group (43.3 percent) and clerks group (41.9 percent). Similarly, a sizeable number of persons with elementary education, that is, those who completed grades 1-6 were observed in the plant and machine operators and assemblers group (22.7 percent), professionals group (17.9 percent) and clerks group (17.6 percent). In general, an insignificant number of persons who have education above elementary level were reported in the last five occupational groups as reported in Table 4.8a. Similar distribution patterns as indicated above were observed in the urban and rural areas of the region (See Tables 4.8b and 4.8c). The illiterates indicated under the legislators, senior officials and managers group seems inflated because of the inclusion of heads of kebeles or community organizers in the major group that will add to the number of illiterate.

4.4.3 Type of Industry

a) Industrial Distribution

About 91 percent of the economically active population of Somali Region were engaged in the agricultural sector. As was indicated in the discussion on occupational distribution section above, here also agriculture is the major sector that absorbed the rural population (See Table 4.9). This is universal in the rural areas of the region where in all the rural areas of the zones, above 91 percent of the rural work force was engaged in agriculture. However, in the urban areas other than agriculture, a relatively higher number of males were observed to be engaged in wholesale and retail trade, repair of vehicles, personal and household goods (27.7 percent) and in public administration and defence (8.1 percent) industrial divisions. Similarly, in the case of females a significant number of them were

found in wholesale and retail trade, repair of vehicles, personal and households goods (43.2 percent) and in hotels and restaurants (7.4 percent) industrial divisions. In most of the zones in the region a significant proportion of the economically active population were reported to be engaged in the agricultural division, wholesale and retail trade, repair of vehicles, personal and household goods division and in public administration and defence, compulsory social security industrial division (See Table 4.9). No systematic distribution pattern was observed in the distribution of females by industrial division in the different zones.

b) Industry and Level of Education

Tables 4.10a, 4.10b and 4.10c present the distribution of the economically active population by major industrial division and level of education for the total region, urban and rural areas, respectively. Table 4.10a revealed that the majority (about 94 percent) of the economically active population of the region were illiterate. The corresponding figures for the urban and rural areas were 70.3 percent and 95.6 percent, respectively (See Tables 4.10b and 4.10c). As was the case in the occupation section above, here also virtually the same phenomena was reflected in each of the industrial divisions. Thus, among the economically active population engaged in the agricultural sector, 95.7 percent and 95.8 percent, were found to be illiterate, for total and rural Somali Region, respectively. For the total region, besides agriculture, a significant proportion of the active persons engaged in manufacturing (85.3 percent), wholesale and retail trade, repair of vehicles, personal and household goods (76.1 percent), hotels and restaurants (51.8 percent) and other social, cultural, personal and household activities (82.8 percent) industrial divisions were reported to be illiterate (See Table 4.10a). On the other hand, a higher proportion of literate active persons that have completed at least grade twelve were reported in education, health and social work (41 percent), public administration and defence, compulsory social security (42.3 percent) and in financial inter-mediation (40.8 percent) industrial divisions.

In the urban areas of the region, due to relatively a higher literacy level compared to the rural areas, the percent illiterates were observed to be much lower in the various industrial divisions (See Tables 4.10b and 4.10c). The data in the urban areas also revealed a higher percent of literate economically active persons that have completed elementary education and

higher level of education for selected industrial divisions (See Table 4.10b). On the contrary, in the rural areas, the majority of the economically active persons in the different industrial divisions were found to be illiterate (See Table 4.10c).

c) Occupation by Industrial Division

The distribution of the economically active population by major occupation and industry is presented in Tables 4.11a, 4.11b and 4.11c for total, urban and rural Somali Region, respectively. The majority of persons engaged in the wholesale and retail trade, repair of vehicles, personal and household goods division and in hotels and restaurants division were reported to be service workers and shop and market sales workers, 89 percent and 98 percent, respectively (See Table 4.11a). The corresponding figures for the urban areas were 91.9 percent and 95.7 percent and for the rural areas 83.4 percent and 99.2 percent, in that order. In the agricultural sector the majority were agricultural workers 69 percent and 65.9 percent for the urban and rural areas, respectively (See Tables 4.11b and 4.11c).

In almost all the industrial divisions a sizeable number of persons engaged in elementary occupations were reported. On the contrary, a small percentage of legislators, senior officials and managers and professionals were observed in the majority of the industrial divisions. There is no much difference in the distribution pattern of occupation by industry between urban and rural areas, except that in the urban areas compared to the rural, more persons that were engaged in the white-collar occupations were observed in selected industrial divisions. Moreover in the rural areas, there were some industrial divisions that were non-existent or with insignificant employed persons. These industrial divisions include the financial-inter-mediation division, real estate, renting and business activities and the extra-territorial organizations and bodies divisions.

4.5 Unemployment

The magnitude or extent of unemployment is measured using the unemployment rate. The unemployment rate is computed as the percentage of the unemployed population over the economically active population. The total unemployment rate of Somali Region was found to

be 5.3 percent for both sexes and males, and 5.4 percent for females (See Table 4.12). For urban Somali Region the rate was high, 31.9 percent, 33.2 percent and 29.4 percent, for both sexes, males and females, respectively. However, in the rural areas the rates were relatively low, 2.0 percent 1.9 percent and 2.4 percent for both sexes, males and females, respectively.

The distribution of the unemployment rate by zone revealed that the highest rate in Degahabur Zone (9.4 percent) and the lowest in Liben Zone (1.4 percent). In general in all the zones the urban unemployment rate was much higher than the rural areas particularly in the urban areas of Korahe, Degahabur and Warder zones that were observed to attain the highest unemployment rate 55.8 percent, 44.2 percent and 35.6 percent, respectively (See Table 4.12).

4.5.1 Unemployment and Relationship to Head of Households

The distribution of the total unemployed population by relationship to head of household and zone is presented in Table 4.13. The table revealed that for both males and females the highest number of unemployed persons were sons /daughters of head and spouse, 44.8 percent and 53.8 percent, respectively. It was also reported that in the urban areas of the region, son/daughter or head and spouse constituted the largest portion of the unemployed for both sexes, for males and for females, 37.2 percent, 34.6 percent and 42.7 percent, respectively. The second and third largest groups in the urban areas were heads of households and son/ daughter of heads only, 24.8 percent and 20 percent, respectively. However, in the rural areas about 68.1 percent of the unemployed persons were sons/daughters of heads and spouse, followed by sons/daughters of heads only (15.9 percent) and heads of households (7.3 percent).

Table 4.13 showed son/daughter of heads and spouses to constitute the highest proportion of the unemployed persons in all the zones. However, in the urban areas of Jigija and Liben zones the ranking was different, that is, the unemployed heads constituted the largest group (42.9 percent) in the earlier, while son/daughter of head and spouse only (29.3 percent), in the latter.

4.5.2 Unemployment and Level of Education

Table 4.14 presents the distribution of the unemployed population by level of education and zone. In Somali Region the majority of the unemployed persons were reported to be illiterate, 83.8 percent, 79.2 percent and 92.3 percent for both sexes, males and females, respectively. On the other hand, unemployed persons who have completed at least high school education were reported to be, 3.3 percent, 4.3 percent and 1.5 percent for both sexes, males and females, respectively. Similar distributions as indicated above were reported in most of the zones in the region. The table revealed that the unemployed persons in the urban areas were better educated than those in the rural areas, where the percent literate was 19.6 percent for urban while for the rural it was about 6.2 percent .

CHAPTER V

POPULATION DYNAMICS

In the 1994 Population and Housing census, data on fertility and mortality condition of the population were collected. The information on these items is useful to measure the change that will occur on the size of the population due to births and deaths.

The information on fertility and mortality are based on the number of children ever born alive and number of children dead and the number of births during the last 12 months prior to the census date. The information on migration was not collected from Somali Region because of the mobile nature of the population of the region.

Data on fertility and mortality are subject to various errors of reporting and interviewing. One of the major factors contributing to this error is the fact that the information is based on past events and hence is subject to memory lapse. Other factors that affect the quality of fertility and mortality data are deliberate miss-reporting on the side of respondents and errors committed by the enumerator through faulty interviewing. Due to these and other problems, indirect methods are used to estimate fertility and mortality parameters.

This chapter is divided into 2 sections. Section 5.1 deals with fertility and section 5.2 presents the mortality condition.

5.1 FERTILITY

This section deals with fertility levels, patterns, trends and differentials for Somali Region. In the 1997 Population and Housing Census, information was collected on both current and retrospective fertility. The information was collected using long questionnaire from women aged ten years and above residing in 20 percent sample households. The results were weighted to represent the entire population.

Data on current fertility was obtained by asking, "Did you have a live birth during the twelve months prior to the census day?". Information on retrospective fertility was obtained by asking about the total number of children ever born alive classified into number of children living at home, number of children living elsewhere and number of children who died.

Data on current and retrospective fertility collected in censuses of developing countries are not usually free from errors. Data on total number of children ever born may be distorted due to recall-lapse and socio-cultural factors (because of the extended family system in the country some women may include relatives with their own). Again, some births, especially those that end in early death may be omitted from being reported. These probable errors should be borne in mind while interpreting reported fertility measures presented in this section.

Based on the data collected on the number of births in the year preceding the census, the following fertility measures are computed.

- Crude Birth Rate (CBR): refers to the total number of births occurring in a given year per 1000 mid-year population.
- General Fertility Rate (GFR): is defined as the number of births occurring in a given year per 1000 women in the reproductive ages (i.e. women aged 15-49 years).
- Age Specific Fertility Rate (ASFR): refers to the number of births that occur in a given year per woman; the rates refer to women aged 15-49 years and are presented in five year age groups.
- Total Fertility Rate (TFR): refers to the number of children a woman may produce at the end of her reproductive period given the current age-schedule of fertility rates.

5.1.1 Reported Current Fertility

The 1997 census reported a Total Fertility Rate of 3.1 children per woman; a Crude Birth Rate of 17.1 per 1000 mid-year population; and a General Fertility Rate of 85.8 per 1000 women at child bearing age. The reported TFR value for urban women was 3.7, while for the rural women it was 3.0 children (Table 5.1.1). The pattern of current fertility by age and parity group (number of children ever born group) of women is presented in Table 5.1.2. The table indicates that about 28 percent of current births occurred among women who had less than three

children, while 13 percent of births occurred among women who already had eight or more children.

TFR			3.095			3.680			2.985

5.1.2 Reported Cumulative Fertility

The other fertility index of interest is the mean number of children ever born. In particular, number of children ever born by women aged 45-49 years can be taken as the level of completed fertility. Data in Table 5.1.3 show percentage distribution of women at child bearing age by number of children ever born and urban-rural residence. The data presented in the table indicate that by the end of her reproductive period, a woman living in Somali Region has an average completed fertility of 5.5 children, while urban and rural women have 5.6 and 5.5 children, respectively. Therefore, comparison of reported completed fertility and TFR reveals a large difference. The major explanation for the observed variation may be decline in the fertility level.

The table also shows that the proportion of women who have no children is 1.2 percent for those in the age group 35-39, while for those in the age group 40-44 it is 2.0 percent and for those in the age group 45-49 it is 0.4 percent. This indicates that a small proportion of women in Somali Region remain childless.

Parity progression ratios for women in Somali Region is presented in Table 5.1.4. Parity progression ratios indicate the probability of a woman progressing from one parity level

to the next higher level. The difference in the ratios between the rural and urban areas for older women is smaller compared to differences among younger women. This implies that the difference in fertility experiences between urban and rural areas was getting wider through time.

5.1.3 Age Pattern of Fertility

Figure 5.1.1 presents the pattern of fertility for 1997 for total, rural and urban areas of Somali Region. The structure of fertility is closely dependent on age, nuptiality characteristics and practice of contraception. Births are observed to occur in the entire period of reproduction.

The fertility rate in the age group 15-19 is very small; but it quickly rises until the 25-29 year and decreases slightly thereafter. The fertility level still remains relatively high even at age group 35-39.

The mean age of fertility schedule was also computed for Somali Region. The value obtained for the total region was 31.67 and it was 31.12 for the urban areas and 31.79 for the rural areas of the region.

5.1.4 Adjusted Fertility Estimates

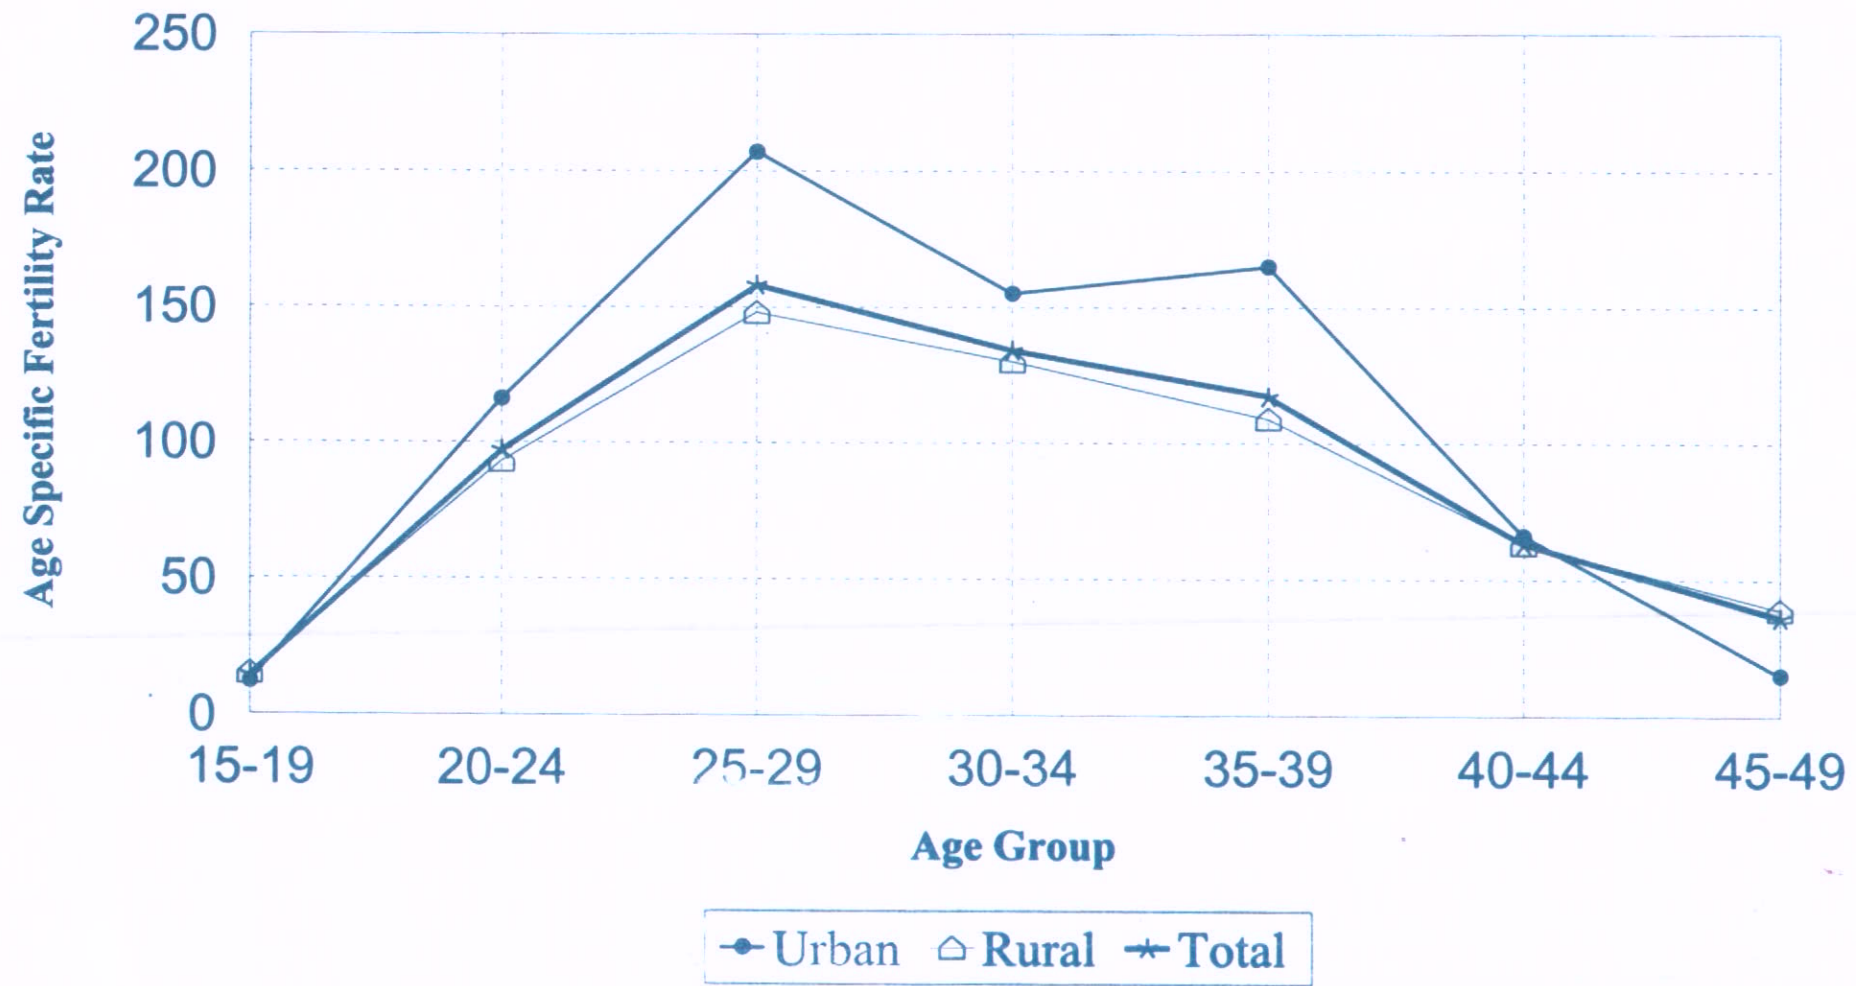

Reported levels of current fertility in developing countries suffer from various sources of errors. One of these sources is that women tend to omit some of their children (particularly those who died during infancy) from reporting. Some women also tend to misunderstand the reference period of twelve months and report births that occurred during a lesser period. Because of these reasons and other related problems, it is customary to adjust the reported level of total fertility to a higher level. Many models that adjust the reported level of fertility have been developed and these have been applied to the data from the census.

The reported current fertility levels for the urban and the rural parts of Somali are adjusted separately. The adjusted rates for the two parts are then averaged (using the number of women in the reproductive ages as weight) to provide the estimate for total Somali. The procedure selected to adjust the reported current fertility of both urban and rural areas is the fitting of the Brass Relational Gompertz model to the age specific fertility and parity data obtained from the census.

Table 5.1.4 Parity Progression Ratios, Somali Region: 1997

Parity Progressions	Age Group						
	45-49	40-44	35-39	30-34	25-29	20-24	15-19

Figure 5.1.1 Reported Age Specific Fertility Rates Per 1000 Women, Somali Region: 1997

Computer programs have been developed that fit the curve to the information supplied and give **adjusted levels of total** fertility rates (US Bureau of the census, 1994). The programs also supply graphs which indicate the goodness of the fit of the data to the model. By using these graphs, points that lie on straight lines were selected to improve the quality of the adjusted estimates. The points selected in the case of urban parts of Somali region are those 15-19, 20-24 and 25-29 while for the rural parts of the region 15-19, 20-24, 40-44 and 45-49 are selected. A least square equation was fit for these points and the results (the slope and the intercept) used in the construction of the adjusted levels of fertility. The model provides adjusted levels of TFR corresponding to all age groups. In the case of urban parts of Somali, the average of the total fertility rates corresponding to ages 15-19 and 20-24 is taken as the adjusted level of fertility while for rural parts of the region the average of the total fertility rates corresponding to ages 20-24 through 40-44 is taken. According to this result, the adjusted Total Fertility Rate for urban Somali is estimated to be 5.84 births per woman, while for rural Somali it is estimated to be 6.89.

Other adjustment procedures applied to both urban and rural parts of Somali provide results which are significantly larger. For example, the application of the Brass P/F procedure provided adjusted TFR of 8.3 for the urban and 9.9 for the rural areas (using average of ages 25-29 and 30-34). Similarly, application of Arriaga One Date procedure provided a value of 8.3 for urban and 8.9 for rural Somali.

The adjusted level of fertility for the entire Somali was computed by taking averages of the adjusted levels for the urban and the rural parts. Weights were used while adding the two figures and the weight used was the number of women in the reproductive ages in each part of Somali. Accordingly, the adjusted level of Total Fertility Rate for total Somali Region was computed to be 6.73.

The number of women interviewed using the long questionnaire (which was used to obtain information on fertility) was very small and is not sufficient to provide adjusted fertility rates by zones.

To obtain the adjusted CBR and GFR for urban and rural areas of Somali Region different weights were used. The weight for the urban areas was obtained by dividing the adjusted TFR of urban Somali by the reported TFR for urban Somali. Similar procedures were followed to obtain the rural weight for the adjustment of the rural CBR and GFR values.

Table 5.1.5 Adjusted Fertility Measures by Area, Somali Region: 1997

Area	Total		
	TFR	CBR	GFR
Total	6.7	37.0	185.3
Urban	5.8	35.7	165.4
Rural	6.9	37.2	189.0

The adjusted level of fertility for Somali Region provided in this report might not be the best estimate that reflects the real situation in the region. This is because there is a huge gap between the reported total fertility rate based on current fertility information and the life time fertility level which have direct impact on the adjustment process. In other words, the overall reported fertility data gathered from the region is highly defective which can undoubtedly be manifested in the adjusted estimates. Hence users are advised to be cautious whenever using and interpreting the reported as well as the adjusted fertility estimates provided in this report.

Information on level of total fertility for various countries was collected in Demographic and Health Surveys (DHS). Summary results from these surveys are published in a series of a journal entitled "Studies in Family Planning" (Population Council, 1990-96). The level of total fertility rates obtained for selected countries is presented in Table 5.1.6. According to the results in the table, the adjusted total fertility rates of Somali Region are higher than fertility estimates presented for all the countries in the table, except for Niger, Yemen and Mali. However, fertility levels reported in Table 5.1.6 are all reported levels, because DHS surveys are conducted under heavy supervision and better organization and no serious errors are expected to occur in the data collected.

Table 5.1.6 Total Fertility Rates Recorded in Demographic and Health surveys in Some Selected Countries.

Country	Year	TFR		
		Total	Urban	Rural
Kenya	1990-92	5.4	3.4	5.8
Sudan	1990-92	4.5	3.8	5.2
Tanzania	1996	5.8	4.1	6.3
Zambia	1989-92	6.5	5.8	7.1
Zimbabwe	1991-94	4.3	3.1	4.9
Botswana	1985-88	4.9	3.9	5.4

Mali	1984-86	6.7	6.1	7.0
Niger	1986-92	7.4	6.7	7.5
Senegal	1989-92	6.0	5.1	6.7
Algeria	1986-92	4.2	3.4	5.2
Morocco	1989-92	4.0	2.5	5.5
Yemen	1989-91	7.7	5.6	8.2
Syria	1990-93	4.2	3.6	5.0
Bangladesh	1993-94	3.4	2.7	3.5
Indonesia	1988-91	3.0	3.2	2.6

5.1.5 Fertility Differentials

The analysis of fertility differentials by selected background variables was made for Somali Region. However, due to the homogeneous nature of the population in the region, and small number of questionnaires that collected fertility information (the results were found to be misleading and) hence the differentials in fertility for the region are not presented in this report.

5.2 MORTALITY

This section deals with mortality levels, trends and differentials for Somali Region. Regarding mortality only one type of information was collected in the 1997 Population and Housing Census. To get the data, all women aged 10 years and over (who were interviewed using the long questionnaire) were asked the total number of sons and daughters they ever gave birth to, and the total number of those who died. This information was then weighted and utilized to provide indirect estimates of mortality. Consequently, expectations of life at birth (e_0); infant mortality rates (${}_1q_0$); child mortality rates (${}_4q_1$); and under-five mortality rates (${}_5q_0$) were derived and shown in Table 5.2.2.

The rates of mortality presented in this section are defined as follows:

- Infant mortality (${}_1q_0$): the probability of dying between birth and the first birthday per 1000 live birth.
- Child mortality (${}_4q_1$): the probability of dying between exact age one and the fifth birthday per 1000 children surviving to the first birthday.
- Under-five mortality (${}_5q_0$): the probability of dying between birth and the fifth birthday per 1000 live birth.
- Expectation of life at birth (e_0): the average number of years a new born baby is expected to live if he/she is exposed throughout its life to the prevailing pattern of age specific death rates.

These results also have already been presented in the Statistical Report for Somali Region (CSA, 1995). The current report however, presents more detailed and in-depth analysis of the mortality levels. It also presents the trend in mortality. To identify the mortality conditions of particular sections of the population, differentials by background variables are presented. Finally, abridged life tables for males and females are constructed.

5.2.1 Estimation of Infant and Child Mortality

In this section, indirect techniques developed by Brass and later modified by Sullivan and Trussell (UN 1983) have been used to estimate mortality from responses to questions on number of children ever born and surviving. These techniques convert the proportion dead among children ever born into probabilities of dying. Infant mortality rates, child mortality rates and under-five mortality rates were computed using a program called QFIVE, developed by the United Nations (UN, 1988). Expectations of life at birth was computed using a computer program called MORTPAK-LITE, also developed by the UN. The reliability of indirect estimates based on information on children ever born and surviving highly depend on the quality of reporting of children ever born, children dead and age of women. In Somali Region, the proportion of women who did not report their parity and number of surviving children were found to be 1.9 percent. These cases were totally discarded from the analysis.

The number of children ever born and the number surviving for Somali Region is presented in Table 5.2.1. Detailed tables by sex, rural and urban areas for each of the zones is also presented in the Statistical Report for Somali Region (CSA, 1995). According to the results in the table, the mean number of children ever born shows a clear increase with age, while the proportion surviving shows a clear decline. As a proxy measure of sex ratio at birth by age of mother, children ever born by age of women used to calculate sex ratio for the region. Result showed that sex ratio was 1.26 for the whole region. This indicates that the quality of the data collected in the region is very bad.

Table 5.2.1 Women Aged 15-49 by Number of Children Ever Born and Children Surviving: Somali Region 1997

Age Group	Women	Children Ever Born	Children Surviving	Mean Ever Born	Mean Surviving	Proportion Surviving
15-19	169809	12917	11682	0.08	0.07	0.90
20-24	111242	127208	114308	1.14	1.03	0.90
25-29	99508	326666	287094	3.28	2.89	0.88
30-34	100348	528003	457554	5.26	4.56	0.87
35-39	77489	497283	426810	6.42	5.51	0.86
40-44	77662	576033	477833	7.42	6.15	0.83
45-49	36906	305443	252081	8.28	6.83	0.83

Estimated expectations of life at birth, infant mortality rates, child mortality rates, and under-five mortality rates are obtained according to the Trussell equations of the West Model mortality pattern of the Coale and Demeny Model Life Tables and the results are presented in Table 5.2.2 for Somali as a whole by sex. The selection of the West Model pattern for the region was based on the data obtained from 1984 census, the 1990 National Family and Fertility Survey (NFFS), and the 1994 census of Ethiopia. The applied technique is to observe the difference in the estimated expectation of life implied by exact ages 2, 3 and 5. This is performed for each of the four families of the Coale and Demeny Model Life Tables. Then the family that gives the smallest difference is considered as the appropriate model that describes the mortality pattern of the population for ages under 5. Accordingly, the 1984 census indicated the West family as the best fit, while NFFS show both South and West family as appropriate patterns of mortality for Ethiopia. The results of the 1994 census also indicated that the North Model followed by the West best fit the mortality pattern of the country. From these observations, it is evident that the West family describes the Ethiopian mortality pattern better. In addition, the West Model is often recommended as a first choice if little is known about the mortality pattern of the population under study (UN 1983). Hence, the West Model Trussell estimates are taken to reflect the final estimates of mortality for the region.

The estimated expectations of life at birth for Somali Region are 56 years for males, 53 years for females and 55 years for both sexes. The infant mortality rates are 90 per thousand for males, 102 per thousand for females and 96 per thousand for both sexes. Child mortality rates expressed per thousand children surviving to the first birthday are 38 for males, 57 for females and 45 for both sexes. Under-five mortality rates are also computed to be 125 per thousand for males, 153 per thousand for females and 137 per thousand for both sexes.

Table 5.2.2 Estimated, Infant, Child and Under-five Mortality Rates and Expectation of life at Birth by Sex: Somali Region 1997

Region	Sex											
	M+F				M				F			
	${}_1q_0$	${}_4q_1$	${}_5q_0$	e_0	${}_1q_0$	${}_4q_1$	${}_5q_0$	e_0	${}_1q_0$	${}_4q_1$	${}_5q_0$	e_0
Somali	96	45	137	54.8	90	38	125	56.2	102	57	153	52.9

${}_1q_0$ = Infant Mortality

${}_4q_1$ = Child Mortality

${}_5q_0$ = Under-five Mortality

e_0 = Expectation of life at birth

As in the case of fertility estimates for the region, mortality estimates are also expected to suffer from the poor quality of the data. Given the poor situation of the region in terms of basic social services like health, water, sanitation, housing conditions and nutrition, on one hand, the prevalence of diseases (like malaria), problems associated with nomadic life and some harmful cultural practices of the population, on the other, both the reported as well as the adjusted levels of mortality by all measures are far from the existing reality in the region. Hence potential users of this document should utilize and interpret the results with caution.

5.2.2 Trends in Mortality

Indirect estimates based on children ever born and surviving provide a trend in mortality. As can be seen from Table 5.2.3, constant mortality trend during the eighties and nineties is observed. The result for the latest period (1996) that was derived from the information of women of ages 15-19 may be considered to suffer from small number of children ever born and thereby giving a less reliable estimate. The estimated level for 1984 which was obtained from women currently aged 45-49 may suffer from memory lapse (particularly of dead children), and therefore, may be considered to be less accurate.

Table 5.2.3 Trends in Expectation of Life at Birth: Somali Region 1997.

Age group of women	Reference date	e_0
15-19	Dec 1996	51.5
20-24	Dec 1995	54.9
25-29	Apr 1994	54.7
30-34	Mar 1992	54.7
35-39	Nov 1989	54.9
40-45	Mar 1987	53.0
45-49	Feb 1984	54.1

5.2.3 Mortality Differentials

Differentials in the level of mortality were examined for selected background variables for Somali Region. However, due to the homogeneous nature of the population in the region and small number of questionnaires that collected mortality information, (the results were found to be misleading and) hence are not presented in this report.

Levels of infant mortality rates recorded for selected countries is presented in Table 5.2.4. The source of the information is the results of the Demographic and Health Surveys (DHS) conducted in these countries. Information from these surveys is published in a series of a journal entitled "Studies in Family Planning" (Population Council, 1990-1996) from which Table 5.2.4 is constructed. According to the results in the table, the region has highest infant mortality rate compared to these countries except for Zambia, Niger and Bangladesh.

Table 5.2.4 Infant Mortality Rates Recorded in Demographic and Health Surveys in Some Selected Countries.

Country	Year	Infant Mortality Rate		
		Total	Urban	Rural
Kenya	1982-92	63	46	65

Algeria	1982-92	54	41	64
Bangladesh	1983-93	101	81	103

5.2.4 Life Tables

To generate the life tables presented in Table 5.2.5 below, estimated expectations of life at birth were used as input values in UN MORTPAK-LITE Computer program MATCH procedure (UN, 1988). The life table columns presented are defined as follows:

- Age:-** The initial age of the age interval $(x, x+n)$, where x is the initial age and n is the length of the interval. The interval n equals 5 years with the exception of the first interval (1 year), second interval (4 years) and last interval (open ended);
- ${}_n m_x$:-** Central death rate for the age interval $(x, x+n)$;
- ${}_n q_x$:-** Probability of an individual at age x dying before the end of the age interval $(x, x+n)$;
- l_x :-** Number of survivors to exact age x in a life table with radix of 100,000;
- ${}_n d_x$:-** Number of deaths in age interval $(x, x+n)$;
- ${}_n L_x$:-** Number of person-years lived in age interval $(x, x+n)$;
- T_x :-** Number of person-years lived at ages x and older ;
- e_x :-** Expectation of life at age x .

Table 5.2.5 Estimated Abridged Life Table by Sex: Somali Region 1997

CHAPTER VI

HOUSING CHARACTERISTICS AND CONDITIONS

6.1 Introduction

The 1997 Population and Housing Census questionnaire included different set of question on housing for urban and rural parts of Somali Region. Thus information on housing characteristics and conditions were collected for residential and partly residential housing units on a sample bases.

In urban areas, information on housing facilities and amenities such as bathing, toilet, types of kitchen, source of water supply, source of power for lighting, types of fuel used for cooking and availability of radio, television and telephone sets were collected during the census. Information on the status of tenure and monthly rent of housing units was also collected for urban areas. On the other hand, in rural areas, information on types of fuel used for cooking, availability of toilet, source of water supply and information on whether there was a separate room in the housing unit used mainly as a kitchen was collected.

This chapter presents statistical data on housing with analysis on housing characteristics and conditions in Somali Region. Thus, in the presentation of the results, some tables refer to urban areas only, a few tables refer to rural areas only, while others refer to both urban and rural areas. The data on housing units of Somali Region consists of summary tables and analysis of data by zones are dealt in this chapter and are presented in six sections.

6.2 Housing Units by Type of Building

During the census, buildings in which housing units are located were identified as either non-storied or multi-storied and each type of building was further classified into detached or attached; and if attached number of units in it was also recorded.

A housing unit is defined as a separate and independent place of abode either intended for habitation or not intended for habitation but was occupied as a living quarter by a household during the census. Although intended for habitation by one household, a housing unit may, at the

time of census be occupied by one or more households or may be used partly for living and partly for establishment.

The distribution of housing units by type of building is shown in Table 6.1. A building is an independent free-standing structure comprising one or more room or other spaces covered by a roof and usually enclosed by external walls or dividing walls that are extended from the foundation to the roof. A building maybe used or intended for residential and establishment, or establishment only. Buildings may contain several sets of living quarters as in apartment building or may constitute one set of living quarter.

The data on housing shows that a total of 79,017 housing units were found in the urban areas, out of which 76,269 (96.5 percent) were found to be in non-storied buildings and 126 (0.2 percent) in multi-storied buildings. Further, it can be observed that in non-storied buildings, 55,067 (69.7 percent) of the housing units were found to be in non-storied detached and 21,202 (26.8 percent) were non-storied attached buildings. Of the total housing units 14.8 percent were two units non-storied attached, 9.7 percent were 3-5 units non-storied attached, and 2.4 percent were six or more units non-storied attached buildings. On the other hand 0.1 percent of the housing units were found to be in multi-storied detached and 0.1 percent were in multi-storied attached buildings. The data in the table indicates that housing units in storied buildings were found to be very few compared with housing units in non-storied buildings.

The table also presents data on type of building by zone, and high proportion of non-storied housing units were observed in all zones. The proportion of housing units in non-storied buildings ranged from 75.6 percent in Fiq Zone to 100 percent in Korahe and Afder Zone.

6.3 Structural Type of Housing Units

Information on type of housing units based on the nature of construction is presented in Table 6.2. The type of housing units were grouped according to whether the housing units were permanent or improvised or mobile or any other. These terms were defined in the census as follows:

Permanent housing unit is a structure that may be expected to maintain its stability for ten years or more and have been constructed with materials such as cement, blockets and bricks or any other building materials.

Improved housing unit is an independent makeshift shelter or structure built of waste materials and being utilized as living quarter at the time of the census.

Mobile housing unit is any type of living accommodation which has been made to be transported and occupied as living quarter at the time of census.

It can be observed from the table that significant proportion of the housing units (42.4 percent) were mobile. The corresponding figures in rural and urban areas were 47.8 and 13.1 percent, respectively. The proportion of mobile housing units ranged from 14.3 percent in Gode Zone to 59.3 percent in Shinile Zone. The data reveals that permanent housing units constituted 39.4 percent, whereas improvised housing units accounted for 17.6 percent. Permanent housing units for the rural and urban areas accounted for 32.3 and 78.0 percent, respectively. The pattern of structural type of housing units observed for the urban areas as a whole also holds true for all zones in Somali Region.

6.4 Quality of Housing Units

The absolute size of a housing unit provides only a crude measure of the extent of shelter in a community. However, it tells nothing about the quality of a housing unit. The quality of a residential housing unit is necessary to appreciate the extent to which the existing housing conditions are regarded as socially desirable in terms of structural quality, rates of occupancy, and other amenities of life. Besides this, knowledge about the materials used for the construction of walls, roofs and floors may be of special significance for the assessment of durability of the housing unit, demand for construction materials,...etc.

The predominant type of material used for the construction of buildings have important implications for setting up housing standards and the development of appropriate housing

construction technology. Here, we will discuss qualitative aspects of the housing units in the following areas: structure, number of rooms, and density of occupation.

6.4.1 Structure

a) Construction Materials of Wall

The distribution of housing units by type of materials used for the construction of wall is shown in Table 6.3. If the walls are constructed from different types of construction materials, the predominant one was reported in the census.

It can be observed from the table that 69.7 percent of housing units in Somali Region had wood and thatch walls and 20.0 percent had wood and mud and about 1.0 percent of the housing units had stone and cement walls. In urban and rural areas of Somali Region housing units made of wood and thatch walls constituted 24.6 percent and 77.9 percent, respectively. Housing units made of wood and mud walls for urban and rural areas constituted 54.5 and 13.6 percent, respectively. Housing units with stone and mud walls accounted for 0.7 percent, while housing units with Reed and Bamboo and blockets accounted for less than one percent. "Other" type of construction materials used for walls constituted 6.9 percent. The table presents materials of construction of walls by zone and out of the total in six of the zones the proportion of wood and thatch was more than 70.0 percent whereas in the remaining zones the wood and thatch walls was less than seventy percent. Significant proportion of wood and mud walls was observed in Gode and Jigjiga, Zones. The proportion of wood and thatch walls ranged from the lowest 47.1 percent in Gode Zone to the highest 90.9 percent in Fiq Zone.

b) Construction Materials of Roof

The majority of the roofs of housing units in Somali Region particularly those of the rural areas have roofs mostly made of thatch grass. Table 6.4 presents the construction materials of roof and indicates that the most prevalent type of material (67.0 percent) used for the construction of roofs was thatch/grass. The construction materials of roofs in the urban areas are of better quality compared to those in the rural areas. In the rural areas the majority of the roofs of housing units are made of thatched/grass and this accounted for 74.5 percent. Only 3.4 percent of the

housing units in the rural areas had roofs made of corrugated iron sheets whereas in urban areas roofs made of corrugated iron sheets accounted for 37.2 percent. Housing units made up of “other” type of material of roofs consisted a considerable proportion (19.2 percent) in the region.

Among the zones the use of corrugated iron sheet for the construction of roof is highest in Warder Zone (13.9 percent) and lowest in Fiq Zone (1.3 percent). A higher proportion (85.5 percent) of housing units with thatch/grass roof were found in Afder Zone, while the lowest proportion (55.6 percent), were found in Degehabur Zone. The proportion of housing units with wood and mud roofs is highest (9.4 percent) in Shinile Zone and lowest in Afder Zone (0.7 percent).

c) Construction Materials of Floor

Data on construction materials of floor were only collected in urban areas. The distribution of housing units in the urban areas by type of materials used for the construction of floor is shown in Table 6.5. It may be observed from the table that the majority (84.1 percent) of the urban housing units had earth/mud floors, about 11.3 percent had cement/concrete floors, 0.6 percent had cement brick tile floors. Wood and Plastic types of tile put together comprised about 1.2 percent of all housing units.

The overall pattern of materials used in the construction of floor observed for the urban areas as a whole also holds for most of the urban areas of the zones. However, among the zones, the use of earth/mud for the construction of floor is highest in Afder Zone (98.9 percent) and lowest in Jigjiga Zone (74.6 percent). Liben Zone and Gode Zone occupy second (97.3 percent) and third (95.7 percent) positions, respectively. The use of cement/concrete in the construction of floor is highest in Jigjiga Zone (20.7 percent) followed by Korahe Zone (13.2 percent), Shinile Zone (11.3 percent) and Degehabur Zone (10.3 percent).

6.4.2 Number of Rooms

In the census a room was defined as a space enclosed by walls reaching from the floor to the ceiling or roof at least to a height of two meters and has a size large enough to hold a bed for an adult. Except for bathrooms, toilets and passage ways, other rooms found in the housing unit were considered as rooms.

One can obtain some idea about spacing in housing unit by examining number of rooms per household and number of persons living per room. The distribution of housing units by number of rooms and zones is presented in Table 6.6a.

It may be observed from the data in the table that the majority of the housing units in Somali Region are not only below standard but also lack adequate spacing. The highest proportion of housing units had only one room (87.2 percent) followed by two rooms (10.2 percent) and those with three rooms constitute about 1.0 percent of the total housing unit. Then the proportion declines steadily with increasing number of rooms. In rural areas, the proportion of housing units with one or two rooms is relatively higher as compared to urban areas. These proportions were 98.3 percent and 92.5 percent in rural and urban areas, respectively. In rural areas only 0.6 percent of the housing unit had 3-4 rooms, while housing units with five or more rooms are non-existent.

As indicated above, the majority of housing units consisted of 1-2 rooms and this also holds for each zone although its magnitude varies from one zone to the other. The housing units with 1-2 rooms were highest (98.8 percent) in Warder and Liben zones and lowest (95.5 percent) in Jigjiga Zone. Housing units with three rooms varies from 0.1 percent in Liben to 2.2 percent in Jigjiga Zone. Housing units with four or more rooms were less than one percent in all zones. (see Table 6.6a.)

6.4.3 Density of Occupation

Density of occupation is consistent with maintenance of health and privacy of occupants. Infectious diseases spread faster in densely populated areas; and it is more difficult to evacuate people during disasters and calamities. There are even suggestions that lack of privacy, high noise levels, and other concomitant of high densities may tend to increase mental illness and maladjustments.

"Over crowding" is usually measured in terms of the average number of persons per room and it is also expressed by the relationship between the average size of household and the number of rooms in the housing unit.

The average number of rooms per housing unit was about 2.9 for the region as a whole. The corresponding figures in rural and urban Somali were 3.4 and 1.8, respectively. The average number of rooms per housing unit was relatively higher in Fiq, Shinile, Korahe and Liben zones and variation between other zones was very small. The number of rooms per housing unit is an adequate measure of crowding or spacing in view of the household size. The average household size was 6.6 for the region as a whole, while these were 6.7 and 6.2 in rural and urban Somali Region, respectively. On the average, about 6.2 persons in rural and 4.5 persons in urban areas live in a room. This number varied from 4.6 person in Jigjiga Zone to 7.8 in Korahe Zone. The average household size ranged from 5.9 in Jigjiga Zone to 8.4 in Korahe Zone. (see Table 6.6b.)

The data in Table 6.7a indicated that 13.2 percent of the housing units are occupied by one to two persons. In the urban areas of Somali Region 86.8 percent of the housing units are occupied by three or more persons per housing unit. The table does not actually reflect the conditions of "overcrowding". The true picture of "overcrowding" would have been brought out if the analysis was restricted to bedrooms only. To give additional information on "overcrowding", the percentage distribution of housing units by number of rooms occupied cross-classified by number of persons is presented in Table 6.7b.

Three categories of density of occupation of housing units could be identified according to the UN recommendation of "Over crowding" (UN,1967), these classifications are:

* Percentage distribution of housing units is computed from the total number of housing units in the urban areas.

Adequately occupied = (Between the two lines) = one to less than three persons per room = 17.8%

Overcrowded = (Below the two lines) = three and above persons per room = 78.8%

Under occupied = (Above the two lines) = less than one person per room = 2%

- a) Housing units with more than one room occupied on the average by less than one person per room are classified as under occupied.
- b) Housing units with one or more rooms occupied on the average by 2.5 or more persons per room are classified as over crowded.
- c) Housing units with one or more rooms occupied on the average by one to 2.4 persons per room are classified as adequately occupied.

Based on the above classification we have also assessed the degree of over-crowding in urban areas of Somali Region and the data in Table 6.7b shows that 2.0 percent of the housing units were under occupied, 78.8 percent were overcrowded and 17.8 percent were adequately occupied.

The distribution of housing units by number of householdes per housing unit indicated that about 0.4 percent of the housing units were shared by two or more households. The number of households per housing unit observed for the region as a whole also holds true for all zones (see Table 6.8).

In rural areas of Somali 84.0 percent of the housing units, the rooms are exclusively used by members of the household. In the remaining 15.4 percent of the housing units members of the household spend the night in the same room with their domestic animals (see Table 6.9).

6.5 Housing Facilities and Amenities

The availability of sanitary conditions is considered to be the most valuable indicator and it is associated with the quality of the housing unit. Beside this, the availability of kitchen facility and the safe and efficient disposal of human waste is considered among the first basic steps which should be taken towards assuring a suitable environment for the well-being of the population.

In urban areas, information on housing facilities such as toilet, kitchen, source of water supply, type of lighting, type of fuel used for cooking, and also availability of radio, television and telephone sets,..etc. were collected in the census. In the rural areas information such as

source of drinking water, type of fuel used for cooking and availability of toilet and whether there was a separate room in the housing unit that was used mainly as a kitchen, or if the room where members spend the night was used as a kitchen, or if the room where livestock spend the night was used as a kitchen were collected in the census.

The basic information to be obtained by the census is whether the housing units have essential amenities and housing facilities. To what extent these amenities are available in Somali Region is examined below.

6.5.1 Source of Water Supply

The supplying of water through pipes is recognized as the most effective means of protecting it from pollution and of ensuring its purity, provided that the water supply system is efficiently administered.

The basic information to be obtained by the census is whether the housing units have piped-water installation. A housing unit may be further classified according to the source of drinking water (tap, protected/unprotected well or spring, river, lake, and pond,.. etc.).

The data on the distribution of housing units by source of water supply is presented in Table 6.10. In general, of all housing units, about 8.2 percent had piped water supply, 42.1 percent of the housing units got their water from river or lakes and 6.8 percent from protected well/spring. The availability of tap and protected water supply for the occupants of each set of housing unit is essential for the prevention of communicable diseases as well as for the cleanliness and general comfort of occupants. It must, however, be noted that a considerable proportion (42.3 percent) of the housing units had got their water supply from unprotected well/spring.

In the urban areas, 38.4 percent of housing units sources of water supply are piped tap water. Housing units which obtained their water from unprotected well or spring constituted 25.5 percent.

It appears from Table 6.10 that unprotected well/spring, river, lake and pond are the usual sources of water supply for the rural households. Almost 45.4 percent of the rural housing units used nearby unprotected well/spring as their sources of water while about 45.1 percent of the housing units used river/lake or pond as their source of water supply. The data show that only 2.7 percent of the rural housing units of Somali Region mentioned piped/ tap water as their sources of water supply. Around 6.3 percent of the housing units used protected well/ spring. It appears from the above findings that only a small number of the rural households have access to pure drinking water, and they are still subject to the use of unclean water.

The distribution of source of water supply by zone shows that in the urban areas of all zones very high proportion of the housing units have access to piped water facilities. This proportion ranged from 7.6 percent in Liben Zone to 66.7 percent in Shinile Zone. In the rural areas, the majority of the housing units used river/lake or pond as their source of water supply and this was highest (64.3 percent) in Gode Zone and lowest (6.3 percent) in Korahe Zone. Among the zones the housing units using unprotected well/spring ranged from 25.4 percent in Liben Zone to 75.7 percent in Korahe Zone.

Table 6.11 shows the distribution of housing units in urban areas by main sources of water supply and its relative location from the housing unit. Of the total housing units, 38.5 percent had piped/tap water supply. Further, it can be observed that about 2.4 percent of the housing units got piped water inside the housing unit and 9.6 percent got piped water within their compound (private or shared), while 26.5 percent of the housing units got piped water from outside the compound.

The distribution of housing units by source of water supply in urban areas for zones shows that Jigjiga Zone had the highest proportion (3.1 percent) of housing units with tap inside the house. The proportion of housing units with piped/tap water varied from 7.5 percent in Liben Zone to 66.7 percent in Shinile Zone, while the proportion of housing units with unprotected well/spring varied from 11.1 percent in Gode Zone to 64.7 percent in Warder Zone. The proportion of housing units with protected well/spring is highest (19 percent) in Fiq Zone and lowest (0.4 percent) in Gode Zone.

6.5.2 Toilet Facilities

Along with the provision of water supplies, the safe and efficient disposal of human waste is one of the measurement of environmental sanitation. From the census, data were obtained on whether the housing units have toilet. A toilet is defined as an installation for the disposal of human excreta. Table 6.12 reveals that 88.4 percent of the housing units in the region did not have toilet facility, whereas only 10.9 percent of the housing units had toilet facility. The corresponding figures for the urban parts constituted 51.6 percent and 47.6 percent, respectively.

Sanitary toilet facilities are very rare in rural areas of Somali Region. Only 4.1 percent of the rural housing units have access to toilet facilities, whereas nearly 95.2 percent of the housing units have no toilet facilities. Among the zones, Afder Zone occupies the lowest position in terms of its access to toilet facilities; about 95.4 percent of its housing units have no toilet facility. The proportion of housing units that have toilet facility varied from the lowest 3.9 percent in fiq Zone to the highest 15.9 percent in Jigjiga Zone (see Table 6.12).

The distribution of housing units in urban areas by type of toilet facility is given in Table 6.13. It can be observed from the table that nearly 51.6 percent of the housing units did not have toilet facility, whereas 1.5 percent had flush toilet private/shared, 46.0 percent dry pit toilet private/shared.

In Jigjiga Zone 60.6 percent of the housing units have toilet facilities, particularly private/shared dry pit. Only 1.0 percent of the urban housing units have access to private flush toilet and this was found to be highest in Korahe Zone (2.2 percent) and lowest in Gode Zone (0.4 percent). The proportion of urban housing units that had no toilet facility varied from 91.9 percent in Fiq Zone to 35.2 percent in Jigjiga Zone.

6.5.3 Type of Lighting

Considerable importance is attached to source of lighting in housing unit. Information collected in the census is the type of lighting in the housing unit such as electricity, kerosine lamp, lantern,..etc. This information could provide planners with useful indication of areas where lighting services are deficient and needs to be extended.

The data on type of lighting were collected in urban areas of the region. Table 6.14 summarizes data on type of lighting used in the living quarters. As can be seen from the table (20.2 percent) of the housing units in the urban areas used electricity. Out of which 14.5 percent of housing units had shared electric meter reader and 5.7 percent had private electric meter reader. Nearly 59.1 percent of the housing units used lantern while 18.7 percent used Kerosine and other source of lighting.

The proportion of housing units that used electricity for lighting varied from 35.8 percent in Jigjiga Zone to 1.1 percent in Afder Zone, while those who used lantern varied from 85.3 percent in Warder Zone to 44.8 percent in Koraha Zone. The use of kerosine and other types of lighting varied from highest 50.5 percent in Afder Zone to lowest 5.9 percent in Warder Zone.

6.5.4 Type of Kitchen

A kitchen is defined as a room primarily used for cooking meals, but due to lack of adequate rooms or space in the housing unit, some persons and/or some livestock may also spend the night in the kitchen. Information was obtained from the census on whether the housing units have a kitchen; whether the kitchen is modern or traditional, or whether it is shared or privately used. Table 6.15 shows that 50.9 percent of the housing units in urban areas had traditional type of kitchen, of which 39.2 percent were private and 11.7 percent were shared. A traditional type of kitchen is a room used mainly for cooking using firewood, charcoal, cotton seeds, sawdust, leaves or barks as fuel, with simple or no stoves and has no piped water or sink. On the other hand 44.5 percent of the housing units had no kitchen facility.

Among the zones, the traditional type of kitchen is found to be highest in Deghabur Zone (57.0 percent), while this was found to be lowest (29.4 percent) in Warder Zone. In addition to this, nearly 67.6 percent of the housing units of Warder Zone had no kitchen facilities.

In Urban areas of Somali Region housing units that had modern kitchen constituted about 3.3 percent. A modern kitchen is a room used for cooking which uses electricity, gas, kerosene, firewood or charcoal as fuel with appropriate stove and had piped water and sink. The proportion of housing units with modern kitchen varied from 0.4 percent in Degehabur Zone to 8.8 percent in Korahe Zone.

The distribution of housing units in rural areas of Somali Region by availability of kitchen facilities is given in Table 6.16. The data reveal that 15.1 percent of housing units had separate room for kitchen; about 37.0 percent use the same room for cooking which is also used by household members for sleeping at night; while 0.8 percent use the same room for cooking where livestock also spend the night. About 46.5 percent of the housing units did not have any kitchen.

The proportion of housing units with separate room for kitchen varied from highest 37.5 percent in Gode Zone to lowest 2.5 percent in Fiq Zone. Among the zones, 73.8 percent of the housing units in Liben Zone did not have kitchen .

6.5.5 Type of Fuel Used for Cooking

The collection of data on the availability of kitchen may provide a convenient opportunity to gather information on the kind of fuel used for cooking. The availability of kitchen and type of fuel used for cooking are important aspects in considering the adequacy of housing. The analysis utilized in the following tabulation express clearly the types of fuel normally used in the region.

The distribution of housing units in rural areas by type of fuel used for cooking is given in Table 6.17. A large proportion (96.1 percent) of the housing units used firewood/leaves. Housing units which used dung/manure constituted 2.7 percent. About 0.3 percent of the housing units used no fuel. Gode Zone had higher proportion (99.5 percent) of housing units that use firewood/leaves and lower proportion of housing units that use dung/manue (0.4 percent). In all zones, housing units which used charcoal and kerosine accounted for less than one percent except warder zone.

Table 6.18 summarizes data on type of fuel used for cooking in urban areas. The data show that 48.1 percent of housing units used only firewood, whereas 1.1 percent used kerosine. The proportion of housing units that used electricity and gas accounted for less than one percent. A significant proportion (30.2 percent) of housing units used a combination of firewood and charcoal, and about 1.3 percent of housing units used a combination of firewood and dung. Nearly 11.2 percent of the housing units used charcoal for cooking.

In general about 80.2 percent of the housing units in the region used firewood and a combination of firewood with other types of fuels such as leaves, dung, charcoal,... etc for cooking, while 1.5 percent of the housing units used a combination of electricity with other types of fuels. The foregoing data revealed that housing units in urban areas heavily depend on sources of fuel such as charcoal, firewood, and the combination of both.

Among the zones, only Shinile and Jigjiga Zones used modern sources of fuel (electricity, gas and a combination of both) and the corresponding figure for Shinile and Jigjiga Zone as a whole was about 2.0 percent . In Afder zone the majority (94.5 percent) of the housing units used firewood/leaves. The use of traditional sources of fuel such as firewood, firewood and charcoal, firewood and dung/manure... etc. accounted for 80.2 percent for the region.

6.5.6 Availability of Radio, Telephone and Television Sets in the Housing Units

There is a need for providing information on basic amenities such as radio, telephone and television sets for the society. Broadcasting plays a vital role in reaching the masses and enabling the government to keep in touch with its people in order to promote their economic, social and political participation to enhance the over all development of the country.

Table 6.19 shows that 17.7 percent of housing units had radio sets. The corresponding figure in urban and rural areas constituted 38.0 and 13.9 percent, respectively. The majority of the housing units (85.6 percent) in the rural areas had no radio sets. Housing units that had no radio sets was found to be highest in Afder Zone (91.7 percent). The table indicates that Jigjiga Zone had the highest proportion (24.1 percent) of housing units with radio sets and Fiq Zone had the lowest proportion (8.4 percent).

The distribution of housing units in urban areas by availability of consumer durable, such as radio, television and telephone sets are presented in Table 6.20. The data reveal that 38.0 percent of urban housing units had radios. Nearly 4.1 percent of the urban housing units had television sets and 2.0 percent had telephone.

Among the zones the proportion of housing units owning television was highest (7.1 percent) in Jigjiga Zone and lowest in Koraha Zone. The proportion of housing units that own telephone sets ranged from 3.0 percent in Warder Zone to 1.1 percent in Degehabur Zone. The table indicates that Afder Zone had no television and telephone sets. The availability of radio, and sets was higher in Jigjiga Zone. The distribution of these amenities in other zones was more or less similar.

It should be noted that at the time of the census, a housing unit was considered as having the required amenities whether it had one or more of the amenities. Thus, the actual number of these sets expected could be higher than the number of housing units reported as having such amenities. Besides, information on sets found in establishments were not collected in the census.

6.6 Type of Tenure

Tenure refers to the arrangements under which the household occupied its living quarters. Tenure information collected for living quarters shows very clearly the distinction between rented units and units that are owner-occupied. A housing unit is considered as rented if the household living in it pays rent to kebele office or to Agency for the Administration of Rented Houses (AARH) or to private individuals or other organization. There are also housing units occupied by households paying difference in rents because they own other housing units that are rented elsewhere for lesser rent than that of housing units they were occupying at the time of the census.

Table 6.21 presents data on tenurial status of the housing units in urban areas. Information on tenurial status of the housing units is necessary for development of housing and establishment of rent policy. Data on rent of housing is also of special significance for housing programs.

The distribution of housing units by type of tenure shows that 77.5 percent of all housing units were owner occupied and 15.6 percent were rented. Out of the rented housing units about 4.0 percent were rented from kebele, 0.6 percent were rented from Agency for the Administration of Rented Houses and 11 percent were rented from private household or other organizations.

The data also shows that 4.9 percent of the housing units were rent free. The proportion of housing units that were owner occupied varied from 95.6 percent in Afder Zone to 61.7 percent in Warder Zone, whereas, the proportion of housing units which were rented varied from 26.5 percent in Warder Zone to 1.1 percent in Afder Zone

6.7 Monthly Rent

Rent is the amount paid monthly for the housing unit occupied by a household. Table 6.22 shows that of the total rented housing units in urban areas, nearly 67.0 percent were rented below 50 Birr per month. Housing units that were rented from 50 to 149 Birr accounted for 29.0 percent and those that rented for 150 Birr and above accounted for 2.2 percent of the total rented housing units.

The proportion of housing units that were rented for below 50 Birr per month ranged from 63.5 percent in Liben Zone to 100.0 percent in Afder Zone. On the other hand, the proportion of housing units that were rented from 50 to 149 Birr per month varied from 9.9 percent in Shinile Zone to 100.0 percent in Fiq Zone and those rented for 150 Birr and above varied from 2.4 in Jigjiga Zone to 10.1 percent in Shinile Zone.

CHAPTER VII

POPULATION PROJECTION

Population projection provides information on the future size and composition of the population of a given area. Knowledge of this information is fundamental for development plans whose target is to satisfy the future needs of the population in the areas of health, education, employment, housing, etc. The basic components of changes in the size and composition of the population of a certain area include fertility, mortality, and migration.

In view of this, this chapter presents the projection of the size, age-sex structure and school age population of Somali Region for the coming 35 years (1995-2030). For this purpose, the cohort component projection method was employed using the DemProj computer program (John Stover; 1990). The method involves projecting separately the three components of population change and applying them to each age group of males and females. In addition to this, DemProj includes a section on AIDS, which allows to evaluate the demographic consequences of the spread of HIV and the progression to AIDS and death. However, due to lack of reliable data on AIDS at regional level, the impact of AIDS on the population is not taken into account.

7.1 Components of Population Projection

The components of the projection required by the DemProj include population size of the total and urban areas by age and sex, fertility, mortality, migration and urbanization.

7.1.1 Age-Sex Composition of the base year population

The age-sex structure of the population count of the 1997 census of Somali Region has been evaluated for its coverage and age reporting errors. Since the age structure is observed to be distorted, strong smoothing is applied to adjust the data for age mis-reporting (Arriaga, 1994). Moreover, the population age-sex structure should refer to the mid point of the base year. To derive the base year population, the exponential growth model ($P_t = P_0 e^{rt}$) is employed. For this purpose, the average annual growth rates of the population of the urban and rural areas of the region are applied. Since the results of the 1994 Population and Housing Census of the Somali Region were found to be erroneous, the census was conducted again on September 11, 1997. Due

to this, backward projection is performed so that the base period of all regions refers to the same date (i.e., July 1, 1995). Table 7.1 illustrates the base year population of July 1, 1995.

Table 7.1 Base Year Population by Sex and Age group, Somali Region: July 1, 1995.

Age Group	URBAN+RURAL			URBAN			RURAL		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

7.1.2 Fertility Component

The fertility input used in the projection is an estimate of the total fertility rate (TFR). The TFR of 6.73 estimated from the 1997 Population and Housing Census data using the Gompertz Model is used as a measure of the level of fertility, while the age pattern of fertility is assumed to be similar to the pattern observed in the reported age specific fertility rates and will be applied throughout the projection period (see the section on fertility). The number of births expected to occur during each projection period will be estimated by applying the adjusted age specific fertility rates to the female population of reproductive ages (15-49). Births are then distributed by sex on the basis of the sex ratio at birth, which is assumed to be 103 male births to 100 female births.

7.1.3 Mortality Component

The expectations of life at birth for males and females are used as basic indicators of the level of mortality. Based on the information on the number of children ever born and surviving obtained from the 1997 Population and Housing Census of the region, the childhood mortality was estimated using the Trussel method. Corresponding to this childhood mortality, the expectations of life at birth were derived assuming that the age pattern of mortality follows the West Model of the Coale-Demeny Regional Model Life Tables. The estimates of expectations of life at birth were 56.2 and 52.9 years for males and females, respectively (see the section on mortality). The age and sex specific survival ratios are also derived from the same model life table.

7.1.4 Migration Component

Data on inter-regional migration is not available. Thus in preparing this projection migration component is not taken in to consideration.

7.2 Future Course of Fertility and Mortality

7.2.1 Fertility

The government of Ethiopia being conscious of the interdependence between economic and social development with high fertility, has launched a national population policy in July 1993. One of the major objectives of this program was reducing the total fertility rate of 7.7 observed for the country at that period to approximately 4.0 by the year 2015. Though the government has set the goal of the population policy at national level, the objective of reducing the Total Fertility Rate (TFR) of the country to 4.0 by the year 2015 can also be extended for regions with prevailing high fertility. In view of this, three alternative assumptions were made in regard to the future course of fertility of Somali Region. These include the high, medium and low variants.

a) High Variant

This variant assumes that the government makes some attempts to reduce the current high level of fertility by introducing different alternative approaches of the national population program to the population of the area: i.e., information education and communication, reproductive health, family planning, etc. However, the availability and effectiveness of these programs will be very limited. In view of this fact, the level of fertility will decrease at a very slow momentum, from an average of 6.76 children per woman between the period 1995-2000 to a TFR of 4 by the year 2030. That means the goal will be attained 15 years later than it was expected. The pace is determined by adopting the United Nations model of fertility decline to the assumption setting the current value of Gross Reproduction Rate (3.32) as the onset value and 1.30 as the final value (UN; 1994). The transition period between these two values becomes 50 years. Since the fertility inputs used in the projection are the values of the TFR, the GRR obtained for each projection period will be converted to the corresponding TFR.

b) Medium Variant

For this variant, it is assumed that the different approaches of the national population program will be moderately effective. Compared to the high series, the medium variant assumes a more faster pace of decline in the level of fertility. The TFR is expected to decrease from its current level of 6.73 to 4.0 by the year 2020 (i.e., five years later than the predicted time), and continues to decline at a slower rate until it attains the final value. Here also the pace is determined by adopting the United Nations model of fertility decline to the assumption setting the onset value of the GRR and the transition period as were in the high variant, the final value of the GRR will be changed to 1.09.

c) Low Variant

In this variant an optimistic assumption is made by expecting that the current high level of fertility will be going to decrease at an accelerated pace and attain a TFR of 4.0 by the year 2015. The decline will also continue at a slower pace thereafter until it reaches the final value. The pace is determined by employing the method used in the previous two variants changing the final value of the GRR to 0.91. Here it is expected that the government will be successful in the

implementation of the different alternative approaches of the national population program to attain its goal.

7.2.2 Mortality

In the case of mortality, only one variant is used for the three different scenarios of the projection. The United Nations has developed three working models of mortality: a slow life expectancy rise; a middle life expectancy rise and a fast life expectancy rise. In the present case, the middle model is applied. This model assumes that life expectancy at birth will increase by 2.5 years every quinquennium till it reaches 60 and 65 years for males and females, respectively. The gain is gradually reduced to 0.4 year at life expectancy of 77.5 and 82.5 for males and females in that order, and thereafter it remains unchanged (UN; 1994).

7.2.3 Urbanization

DemProj provides the size of the urban population by age and sex using as inputs the base period urban population and, either urban-rural growth rate difference or the projected percentage urban for each five year projection period. In the present case since urban and rural growth rates are not available for Somali Region, the use of the projected percentage urban is preferred. The projection of the percent urban is based on the proportion urban of the region obtained from the 1997 census count (i.e., 14.32%) and the urban rural growth rate difference of the region. In the absence of data on urban-rural growth rate difference at regional level, the difference in the urban-rural growth rates observed at national level will be applied to the region assuming that it will remain constant during the entire projection period. The projection of the percent urban is performed using the United Nations formula (UN; 1987) which assumes that the ratio of urban to rural populations at time t , denoted by $s(t)$, grows n years later as follows:

$$s_{(t+n)} = s_{(t)} \exp [(r_u - r_r)n] = s_{(t)} \exp [gn]$$

where r_u and r_r are the rates of growth of urban and rural areas, respectively and $g = r_u - r_r$ is the urban-rural growth rate difference.

Table 7.2 Inputs Used In the Projection for Different Variants (1995-2030)

Input	Variant	Period						
		1995- 2000	2001- 2005	2006- 2010	2011- 2015	2016- 2020	2021- 2025	2026- 2030
Fertility (TFR)	Low	5.95	5.17	4.68	4.19	3.78	3.36	2.95
	Medium	6.30	5.83	5.33	4.81	4.29	3.77	3.32
	High	6.73	6.48	5.99	5.42	4.85	4.28	3.74
Mortality (Eo)	Medium							
	Eo (Male)	56.2	58.7	61.2	63.5	65.8	67.8	69.3
	Eo(Female)	52.9	55.4	57.9	60.4	62.9	65.4	67.7
Urbanization (% Urban)				Period				
	1995	2000	2005	2010	2015	2020	2025	2030
	13.79	15.15	16.65	18.29	20.09	22.07	24.25	26.64

7.3 Projection Results

Three different variant population projections are made on the basis of the above three alternative assumptions regarding fertility and only one assumption being employed with regard to mortality and urbanization. The projection under the medium variant is assumed to be more plausible than those given by the low and high variants. For the medium variant, the total, urban and rural population by sex in single years covering the period 1995-2030 is provided in Table 7.3A, while Tables 7.3B and Table 7.3C illustrate the above results for the low and high variants, respectively. Tables 7.4A-7.4F present the age sex breakdown in single years covering the period 1995-2000 under the medium variant. Tables 7.4G-7.4L, 7.5 and 7.6 demonstrate the age-sex breakdown at five-year intervals up to the end of the projection period under the medium, low and high variants, respectively. Working age population can also be obtained from these tables.

7.3.1 Total, Urban and Rural Population

Results from Table 7.3A indicate that under the medium variant, the total population of Somali Region will increase from about 3.4 million in 1997 to about 4.8 million in 2010, and about 7.3 million in 2030. On the other hand, the urban population is expected to increase from about half million in 1997 to about 0.9 million in 2010, and about 1.9 million in 2030. The rural

population will increase from about 2.9 million in 1997 to about 3.9 million in 2010 and 5.3 million in 2030. The 1997 total and urban population of Somali Region will almost double in 30 and 16 years, respectively. The doubling time for the urban population will become less than that of the total population of the region due to rural to urban migration. If however, fertility will decrease as assumed in the low variant, the 1997 urban population of the region will double in 2014 while that of the total is expected to double after 2030.

7.3.2 Summary Demographic Indicators

For each variant, DemProj also provides summary demographic indicators which include, total fertility rate, male and female life expectations at birth, infant mortality rate, under five mortality rate, crude birth rate, crude death rate, rate of natural increase, average annual population growth rate (TFR, Male LE, Female LE, IMR, U5MR, CBR, CDR, RNI, GR), sex ratio and dependency ratio for every five year interval during the entire projection period. Table 7.7 shows the summary indicators for the three different scenarios.

From the table it can be seen that the annual rate of population growth for Somali Region as a whole implied in the medium variant decreases from 2.6 percent to 1.7 percent within the projection period. Though the growth rate of the urban population will also decrease as year advances, it still remains high at the end of the projection period (i.e., 3.6 percent).

Under the medium variant, the crude birth rate will decrease from 37 per thousand between 1995-2000 to 34.3 per thousand during the period 2005-2010, and 23 per thousand during the period 2025-2030. The crude death rate is also expected to decrease from 11.2 deaths per thousand to 5.6 deaths per thousand within the projection period. These tendencies are in conformity with the assumption of decreasing fertility and mortality over the entire projection period.

7.3.3 Projection of School Age Population

To satisfy the population data demand of Somali Region in planning future educational services, the projection of the school age population is believed to be fundamental. In view of this fact, the three categories of the different levels of education i.e., primary (7-12 years), junior

secondary (13-14 years) and senior secondary (15-18 years) are projected under the three variants. **Table 7.8** presents the school age population in single year interval covering the period 1995-2030 (35 years) for the three different scenarios.

Under the medium variant, the senior secondary level school age population is expected to increase from about 331 thousand in 1995 to about 590 thousand in 2030. On the other hand, the elementary level school age population will rise from about 591 thousand in 1995 to about 914 thousand in 2030. The result indicated that the 1995 senior secondary level school age population as well as that of the elementary level school age population will take more than 35 years to double.

**Table 7.3A Projected Total, Urban and Rural Population Size (in thousands) of Somali Region
by Sex, in Single Year; Medium Variant: 1995-2030**

Year	URBAN+RURAL			URBAN			RURAL		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice to ensure transparency and accountability.

2. In the second section, the author outlines the various methods used for data collection and analysis. This includes both primary and secondary research techniques, as well as the use of statistical software to process large datasets.

3. The third section provides a detailed overview of the findings from the study. It highlights several key trends and patterns observed in the data, which are discussed in the context of the research objectives.

4. Finally, the document concludes with a series of recommendations for future research and practical applications. These suggestions are based on the insights gained from the current study and aim to address the limitations identified during the research process.

Appendix I Short Questionnaire (English Translation)

1997 SOMALI POPULATION AND HOUSING CENSUS SHORT QUESTIONNAIRE

LOCALITY NAME _____

SECTION 1 - AREA IDENTIFICATION

1. KILLIL	2. ZONE	3. WEREDA	4. TOWN	5. KFFETEGNA	6. SUPERVISION AREA	7. FARMERS' ASSOCIATION	8. ENUMERATION AREA

SECTION 2 - TYPE OF RESIDENCE AND HOUSING UNIT PARTICULARS

9. TYPE OF RESIDENCE	10. HOUSING UNIT SERIAL NO.	11. HOUSE NO./SUB NO.	12. HOUSEHOLD SERIAL NO.
1=CONVENTIONAL HOUSEHOLD 2= HOTEL/HOSTEL 3=OTHER COLLECTIVE QUARTERS 4= NOMADS 5=HOMELESS			

SECTION 3 - PARTICULARS OF HOUSEHOLD MEMBERS

SERIAL NUMBER OF HOUSEHOLD MEMBERS	NAME OF USUAL HOUSEHOLD MEMBER	RESIDENCE STATUS	RELATIONSHIP TO HEAD OF HOUSEHOLD	SEX	AGE	ETHNIC GROUP	MARITAL STATUS
	LIST NAMES OF MEMBERS IN THE FOLLOWING ORDER - HEAD - SPOUSE - NEVER MARRIED CHILDREN ACCORDING TO SENIORITY IN AGE - MARRIED CHILDREN AND THEIR HOUSEHOLD MEMBERS WHO LIVE IN THIS HOUSING UNIT - OTHER RELATIVES - NON-RELATIVES - VISITORS	1= RESIDENT PRESENT 2= RESIDENT ABSENT 3= VISITOR	0=HEAD 1=SPOUSE 2=SOM/DAUGHTER OF HEAD AND SPOUSE 3=SOM/DAUGHTER OF HEAD 4=SOM/DAUGHTER OF SPOUSE 5=MOTHER/FATHER OF HEAD/SPOUSE 6=SISTER/BROTHER OF HEAD/SPOUSE 7=OTHER RELATIVES 8=NON RELATIVES	1= MALE 2= FEMALE	WHAT IS _____'S AGE ? ENTER AGE IN COMPLETED YEARS. IF _____'S AGE IS UNDER ONE YEAR, ENTER '00' IN THE COLUMN	WHAT IS _____'S ETHNIC GROUP ?	10 YEARS AND ABOVE 1=NEVER MARRIED 2=CURRENTLY MARRIED 3=DIVORCED 4=WIDOWED
13	14	15	16	17	18	19	20
