46 STATISTICAL BULLETIN 46

P R E F A C E

This survey was carried out in January 1981. Despite delays due to computer breakdowns the data processing was completed towards the end of 1982. The result indicated a population estimate close to 36.0 million. This estimate was found to be substantially higher compared with the corresponding official estimate of about 31.0 million for the period.

The survey which was the biggest in terms of area and household coverage, was also better designed and well conducted than any of the previous surveys executed by the Central Statistical Office. In spite of this, because the new population estimate was substantially higher than the official estimate for that period, hence, there was a need to check the result against other independent sources. A map work for the population and housing census was underway at that time, whose work included not only the delination of enumeration areas but also the listing of heads of households and recording of household members. This exercise resulted in a population estimate for the areas (towns, weredas, awrajas and regions) covered by the census map work. The population estimates from the survey and census map work have been found to compare very well. In spite of this, considering that the first ever national population and housing census was scheduled for April 1983 (later postponed to May 1984), it was decided to release to users the rates and ratios obtained from the survey and delay the release of the population estimate until the result of the national population and housing census is known. Hence, the delay in the publication of the survey result.

This report presents summary of the findings and detailed tables at national and regional levels. It is expected to be followed by a report which presents an indepth analysis of data on population characteristics, fertility, mortality, migration and the inter-relationships of the population dynamics with the various characteristics of the population.

REPORT ON THE RESULTS OF THE 1981 DEMOGRAPHIC SURVEY

Introduction

This report presents the results of the first round of the 1981 Demographic Survey. The Survey was one of the series of agricultural, economic and social surveys that constituted the National Integrated Household Survey Program. The program was launched by the Central Statistical Office covering the rural sedentary population of the country (except Eritrea and Tigray regions) towards the end of 1980. The program actually started with the launching of the Agricultural Sample Survey in November 1980, and followed by the Demographic Survey in January 1981.

The Demographic Survey was a two round survey, in which basic population characteristics, current and retrospective fertility and mortality information were collected in the first round and a year after in the second round, changes in household composition, and the number of vital events that occurred during the year were recorded and measured (see the questionnaire in Appendix 2 for details). The aim of the second round was to measure population change, rate of population growth, crude birth and death rates, and migration rates. Fortunately, in 1981 both the Ethiopian Christmas for the Christians and Moulud (the birth of Mohamed) for the Moslems fell in January. Hence, the duration between January first 1981 and January second 1982 was used as a reference period in order to help respondents in recalling vital events that occurred during the one year period. Thus the Demographic Survey first round was conducted in January 1981, and the second round was conducted in January 1982.

The Demographic Survey was designed to cover a sample of 500 farmers associations, and 50,000 households in the sedentary rural areas in the 12 regions of the country (excluding Eritrea and Tigray). However, the survey actually covered 477 farmers association areas and 46,307 households in 419 agriculturally important weredas. Although the selection of the 500 farmers association areas was made on probability proportional to size of farmers association areas within regions, the actual coverage was slightly lower than the originally planned 500 sample farmers associations due to inaccessibility and other problems beyond

the control of the office. The distribution of covered farmers' association areas by regions was: 31 in Gamo Gofa; 32 each in Bale, Harerge and Keffa, 33 each in Arssi, and Sidamo; 34 each in Gondar and Wello, 35 in Illubabor; 36 in Gojjam; 49 in Wellega, and 96 in Shewa.

Once the farmers' association areas were selected, and as the resident enumerator reached his/her area of assignment, a complete listing of all households and holders was made. The listing produced 177,793 households of which 167,083 were agricultural holders in the selected 477 farmers association areas, giving a ratio of one agricultural holder for every 1.06 households or conversely 0.94 holder per household. The average number of agricultural holders and households per farmers' association area were 350, and 373 respectively. From the list of households, a sample of 100 households were selected for the demographic inquiry according to the sampling plan. The resident enumerator in selected farmers' association area completed the demographic survey questionnaire by canvassing all households selected in the sample. The detailed sampling methodology is treated in " Central Statistical Office, Methodological Report for the period of 1980-83, Statistical Bulletin 34". Besides the sampling design, method of estimation, and sampling error estimates for this survey is given in appendix 1.

This report mainly consists of statistical tables by regional breakdown accompanied by short introduction and summary of selected variables. The statistical tables deal with population size, age, sex, marital status, disability status, religion, ethnic group, place of birth, length of continuous residence, literacy, school attendance, highest grade completed, survival of parents, number of children everborn and number of births in the last 12 months, deaths in the household in the last 12 months. For some variables only summary tables are given, and for other variables both summary and detailed tables are presented. At this juncture, it is worth noting that the population size and other population data given in the detailed statistical

tables only refer to the sedentary rural population of surveyed regions.

Main Results of the Survey

Estimate of the Surveyed Population

The surveyed rural population of the 12 regions was estimated at 25,704,786, and the sex ratio was 104 males per 100 females. The number of households covered in the survey were estimated as 5,388,868, and the average household size was 4.8 persons. The detail is given as follows:-

Males	=	13,110,402
Females	=	12,594,384
Both sexes	=	25,704,786
Sex ratio	=	104 males per 100 females
Total households	=	5,388,868

Age and Sex Structure of the Surveyed Population

The age-sex structure of the surveyed population presented in Table 1 indicates that out of the total population 47.5 percent were children under the age of 15, population aged 15-64 years were 48.2 percent and 4.3 percent were population aged 65 years and over. Although males predominate at ages under 15 years, and at ages 65 years and over, females exceed males in the age range 15-64 years, especially at ages 20-44 where the predominance of females was greatest. The excess of females in the reproductive ages could probably be due to large female age under statement in these ages.

Table 1. TOTAL POPULATION BY SEX AND BROAD AGE GROUP

Age Group	Sex	Number	Percent	Sex Ratio
Under 15 years	Male	6,294,445	48.1	
	Female	5,919,595	47.0	
	Total	12,214,040	47.5	106
15-64 years	Male	6,165,474	47.0	
	Female	6,234,774	49.5	
	Total	12,400,248	48.2	99
65 years and over	Male	650,483	4.9	
	Female	440,015	3.5	
	Total	1,090,498	4.3	147
Not stated	Male	2,804	0.0	
	Female	2,455	0.0	
	Total	5,259	0.0	114
Total	Male	13,110,402	100.0	
	Female	12,594,384	100.0	
	Total	25,704,786	100.0	104

Reported and Adjusted Vital Rates

The reported and adjusted vital rates are given in Table 2. The vital rates show that both the levels of fertility and mortality were high. For the surveyed 12 regions combined, the estimated crude birth rate was 46.9 and the crude death rate was 18.4 per 1000 population resulting an annual rate of natural increase of 2.9 percent. The total fertility rate was 6.9 and the gross reproduction rate was 3.4. The general fertility rate was 211 and the mean age of fertility schedule was 30.1 years. The expectation of life at birth was 46 years, infant mortality rate, was 144.0 per 1000 live birth and death rate to children aged 1-4 years was 30.0 per 1000.

Table 2. ESTIMATES OF VITAL RATES FOR THE AREAS COVERED
IN THE SURVEY

Vital Rates	Reported	Adjusted
Crude birth rate (0/00)	43.4	46.9
Crude death rate (0/00)	11.5	18.4
Rate of natural increase (0/0)	3.2	2.9
Gross reproduction rate	3.4	3.4
Total fertility rate	6.8	6.9
General fertility rate	211	211
Mean age of fertility schedule	30.1	30.1
Infant mortality rate (0/00)	112	144
Child death rate (ages 1 - 4)	19	30
Expectation of life at birth	-	46
- Total	-	46
- Male		45
- Female		47

The adjusted estimates of vital rates by regions are given in Table 3. These vital rates should be used with caution for some of the observed regional variations in fertility and mortality may be due to errors in the reported data. Thus further studies and analysis are required to establish the levels, and trends of fertility and mortality by regions.

Table 3. ADJUSTED ESTIMATES OF VITAL RATES FOR THE AREAS COVERED IN THE SURVEY

Regions	Infant mortality rate (0/00)	Expectation of life at birth in years	Crude birth rate (0/00)	Crude death rate (0/00)	Rate of natural increase %	Mean age of fertility schedule	Gross Reproduction rate per woman	Total fertility rate per woman

Wello	145	45.8	39.6	18.9	2.1	32.1	2.91	6.0
Total	144	46.0	46.9	18.4	2.9	30.1	3.38	6.9

Total Population Estimate for January 1981

The 1981 Demographic Survey which covered the sedentary rural population in twelve regions included 77 awrajas and 419 weredas. However, the survey did not cover 36 weredas within the surveyed awrajas and also excluded 8 nomadic awrajas (five in Hararge, two in Bale, and one in Keffa). Table 4 gives the number of awrajas and weredas covered by region, and the names of awrajas and weredas that were not covered in the survey.

Based on the results of 1981 Demographic Survey the rural population, for the areas covered in the survey, for January 1981 was estimated at 25,704,786. On the basis of this survey result, an attempt was made to estimate the total population of the country as of January 1981 by regions for rural and urban areas. For the surveyed region, the population estimate of the non-surveyed awrajas and weredas was made using the results of census cartography and previous survey result estimates of the Central Statistical Office were used for areas where census cartography were not carried out at that time. Since the survey did not cover Eritrea, Tigray and all urban areas, estimates of the Central Statistical Office for January 1981 were taken for Eritrea and Tigray as well as for urban areas.

In Table 5, presents an estimated total population of the country for January 1981 using the estimated survey population for the surveyed areas, and by estimating the population of the non-surveyed rural areas, and all urban areas on the basis of previous censuses and survey results. The results presented in Table 5 gave an estimated population of 36,444,896 for the country of which the rural population stood at 32 million and the urban population at 4.5 million. The surveyed rural population accounted for 80 percent of the total rural population.

Table 4. NUMBER OF AWRAJAS AND WEREDAS COVERED AND NAMES OF AWRAJAS THAT WERE NOT COVERED IN THE SURVEY

Region	Covered Awrajas Weredas Number Number	Names of Uncovered Awrajas	Names of uncovered weredas within partly covered awrajas
Arssi	3 21		Golelcha wereda in arbagugu awraja.
Bale	3 10	Dolo; Elkerie	Kokossa and Nensibo in Genale awraja; Raitu and Legehida weredas in Wabie awraja.
Gamo Goffa	4 21		Morsibodie wereda in Geleb and Hamer Bako awraja.

1. Sample design

A stratified two-stage sample design was adopted for the rural demographic sample survey: the stratification being at awraja level. Entering to each awraja (stratum) farmers' associations (FAs) were selected as primary sampling units without replacement using probability proportional to measures of size; measures of size being total members of the respective FAs. All in all 500 FAs were selected. Within each selected FA 100 households were randomly selected from lists of households by FA generated after the selected FAs were identified.

The geographic coverage of the survey included all administrative regions, except Eritrea and Tigray. Furthermore, the nomadic population and the non-agricultural households were not included. In addition, the urban areas are not covered.

The schedules were administered to the selected households by way of interview method.

2. Estimation procedure

The estimation procedure adopted directly stems from the sample design and hence it is design-unbiased.

Notations

- Let Y_{hij} = A measure of characteristic Y for the j^{th} household in the i^{th} FA of stratum h.
- h_{hi} = Sample households in the i^{th} FA stratum h.
- H_{hi} = Total households in the i^{th} FA of stratum h. (obtained from the listing in the FA.)
- Φ_{hi} = $\frac{M_{hi}}{M_h}$ = probability of selection of the i^{th} FA.
- M_{hi} = Measure of size of the i^{th} FA in stratum h.
- M_h = Measure of size of the stratum h.
- n_h = Sample FAs in stratum h
- \hat{Y}_h = Estimated total of characteristic Y in stratum h.

YR = Estimated total of characteristic Y in region R.

K = Number of strata in region R.

$$\hat{Y}_{hi} = \frac{H_{hi}}{n_i \phi_i} \sum_{j=1}^{h_{ni}} Y_{hij}$$

$$\hat{Y}_h = \sum_{i=1}^{nh} \hat{Y}_{hi}$$

$$\hat{Y}_R = \sum_{h=1}^K \hat{Y}_h$$

3. Estimates of sampling error.

In order to facilitate the estimation of the variance of \hat{Y}_h , it is assumed that FAs are selected independently with replacement. This may have an effect of a slight over estimation of the variance.

The formula for the variance estimate is given by:

$$\hat{\text{Var}}(\hat{Y}_h) = \frac{nh}{nh-1} \left(\sum_{i=1}^{nh} Y_{hi}^2 - \frac{Y_h^2}{nh} \right)$$

$$\hat{\text{Var}}(\hat{Y}_R) = \sum_{h=1}^K \text{Var}(\hat{Y}_h)$$

$$\text{Coefficient of variation, } C_v(\hat{Y}_h) = \sqrt{\frac{\text{Var}(\hat{Y}_h)}{Y_h}} \times 100$$

$$C_v(\hat{Y}_R) = \sqrt{\frac{\text{Var}(\hat{Y}_R)}{\hat{Y}_R}} \times 100$$

Following is a table showing estimates and measure of precision of 5 characteristics chosen from the survey at regional and for the 12 regions covered in the survey.
