Subsequent to the 1984/85 drought and consequent famine, which affected especially the northern parts of the country, a major resettlement programme has been undertaken. The government was involved in moving over half a million people who had no prospect of being self-sufficient in their old habitat which mainly consisted of degraded lands. After resettlement the government supported the settler families by providing them with food, health care, clothing, etc. until they were able to support themselves. The government also built basic community infra-structures and amenities such as schools, health stations, roads and facilitated the provision of potable water systems, market places, flour mills, etc.

Following the beginning of the resettlement programme many concerned governmental and nongovernmental agencies have closely following up developments in these areas. The government and a number of nongovernment organizations were involved in helping and assisting settlers adjust smoothly to their new environment as conditions and ways of life. Some attempt was also made to collect some data in order to document these events and development both to capture their historical attributes and to draw appropriate lessons for any possible future resettlement programmes.

The above mentioned efforts were no substitute to the type of desired quantitative information needed by both government and non-

government organization concerned with the monitoring and evaluation of developments of various aspects of the resettlement programme and the resettled population. The Central Statistical Authority (CSA) as the most appropriate government body regarding the provision of such information, with financial assistance of the International Development Research Center (IDRC) of Canada and the Canadian International Development Agency (CIDA) undertook a programme of data collection activities in 1988 in all the resettlement areas, covering a wide range of socio-economic fields.

The planning and implementation of the data collection and subsequent data processing analysis and report writing was coordinated by the General Manager of CSA assisted by a committee of six experts drawn from various departments of the Authority. The committee member, who were subject-matter specialists were responsible for at least one survey from the beginning (preparations) to the end (analysis and report writing). The committee formed in early 1987 was responsible for the preparation of all major aspects of all the surveys including the planning of the studies, determination of the design and methodology finalizing questionnaires and instruction manuals, planning and following of the recruitment, training and deployment of field staff and the conduct of data collection and processing.

The data collection activities materialized in May and June 1988 during which period a census of the resettled population was undertaken followed by a number of baseline socio-economic sample surveys which

included an Agricultural Survey; Health and Nutrition Survey; Household Income, Consumption and Expenditure Survey; Demographic Change Survey and Community Level Variables Survey. The results of these studies are expected to provide valuable information on the state of the re-settled population.

The Household Income, Consumption and Expenditure Survey, which is the subject of this report, was concerned with generating useful data on income, consumption and expenditure of the settled population including some household characteristics. The data collected through this survey were processed by computer and the results are given in many tables and analysed carefully in the main body of this report. The preparation, analysis and report writing of this survey was made by Million Tekie, currently Deputy G/Manager of Economic and Social Statistics. He was assisted by Zena Selassie Seyoum currently statistician in the Department of National Accounts, Household Budget and Prices and the technicians in the same department.

This study would not be possible without the financial assistance provided by the International Development Research Center (IDRC) of Canada and the Canadian International Development Agency (CIDA). The CSA wishes to express its appreciation for the financial assistance provided by IDRC and CIDA.

Thanks are also due to the regional party and government officials for their invaluable assistance in the successful execution of the field work, and to the staff of the CSA for their efforts in undertaking the

data collection and compilation work as well as the preparation of this report. I am confident the results of this survey will furnish a useful information for policy makers, planners and administrators concerned with the present and future resettlement programme.

Mitik Beyene, General Manager
Central Statistical Authority

1. Introduction

Following from the felt need for collecting information on various socio-economic characteristics of the resettled population, a household income, consumption and expenditure survey was conducted among other base line socio-economic surveys conducted from May-June, 1988. The survey of income, consumption and expenditure was administered among households in resettlement areas from June 1 to 23, 1988 and information was collected from statistically selected 3,208 households. The sample of households was selected from 117,236 households with an estimated 440,000 resettled population in five administrative regions.

The main purpose of this survey was to examine the consumption, the size distributions of income, and expenditure of the resettled population in relation to their demographic and socio-economic characteristics of households. Comparison of the results was made with the 1981/82 survey results, to evaluate the level and status of the income, consumption and expenditure of the settlers with the situation observed in 1981/82.

The objective, scope and coverage, method of data collection, data processing, concepts and definitions as well as the limitations of the data are discussed in the next six sections of the report. The results are presented and considered in section eight and an inter-area comparison is also attempted. In the final section highlights of the main findings of the survey are presented with few concluding remarks.

2. Objectives

The survey was designed to meet the following specific objectives:

- 2.1 to examine the pattern of consumer behavior
- 2.2 to compare consumption expenditure, income and receipt per household per month for settlers and to compare the results with similar information collected by similar survey in 1981/82.
- and 2.3 to supplement the sources of information available to assess the condition of settlers.

3. Scope and Coverage

The survey was carried out among households in conventional resettlement areas and those households resettled in already existing sparsely populated farmers' association areas.

The survey was intended to study income and expenditure pattern of the sample households in relation to demographic and socio-economic characteristics of the households. Thus information on demographic and general particulars, income, expenditure, other receipts and disbursements and on reasons for disposing of donated items was collected from each household with the help of the following schedules:

- Schedule
- I. Identification Particulars of the Household
 - II. Particulars of Household Members
 - III. Expenditure of the Household in the Reference Month and Past 12 Months
 - IV. Receipts of the Household in the Reference Month, Purchase of Items by Selling Donated Items and Reasons for Purchasing.

4. Method of Data Collection

In this survey method of personal interview and objective measurement was adopted to collect information from the selected households. Information for only one month was collected by the survey and thus no account was taken of seasonal variation in income and expenditure.

In seeking information on income and expenditure visit was made to the household in which expenditure and income data for the reference month were recorded. For clothing and household durables additional information was collected for 1st 12 months which also included the reference month. The rest of the information on household other than income and expenditure data was collected on the survey date.

5. Data Processing

Data processing has a number of functions. Among these the most important are editing, coding, tabulation and preparation of summary tables.

After the field work which took about 23 days (beginning of June to June 23, 1988), editing, coding and verification of the questionnaires were done manually from October 11 to December 26, 1988. Data entry took 47 days (November 30, 1988 to January 16, 1989) and data cleaning lasted for 76 days (February 11 to April 27, 1989). The production of tables with computer, the calculation of per household, per person and percentage values and the

preparation of summary tables manually has been a continuous process since May 28, 1989 to June 1990. The processing activities which has almost taken two years could not be expedited due to delays at various processing stages and specially due to the problem in producing last stage tables with computer which led us to resort to manual processing and use of desk calculators.

6. Concepts and Definitions

Here, we shall define some of the important technical words which are used in the survey.

6.1 Household:- constitutes of a person or group of persons, irrespective of whether related or not, who normally live together in the same housing unit or group of housing units and who have common cooking arrangements.

6.2 Member of Household:- person constituting a household is called member of the household.

The following are considered as members of a household:-

- a) All persons who lived with the household for at least 6 months including those who were not with the household at the time of the survey and were expected to be absent from the household for less than six months.
- b) All guests and visitors who stayed with the household for six months and above.
- c) Servants, guards, baby-sitters, etc. who lived with the household even for less than six months.

6.3 Household Size:- It is the total number of members of a household.

6.4 Head of Household:- is a person who economically supports or manages the household or for reasons of age or respects, is considered as head by the household or declares himself as such.

6.5 Income:- refers to domestic consumption of own crops and own livestock and livestock products, domestic consumption of goods and services purchased for resale or produced or processed in the household enterprise other than agriculture, wages and salaries, allowance, overtime, bonus, pension, commission, discounts (ie., concessions obtained), imputed rent of free housing (provided by employer), imputed rent of employer subsidized housing (ie., subsidized amount only), other employee's benefit, interest received, profit, and dividend received, imputed rent of owner occupied housing, remittance (regularly received), value of items obtained free, rent of personal possessions, alimony (regularly received) and other types of income.

6.6 Receipts:- refers to income plus 'ekub' and 'edir', gifts, loans, repayments of loans, insurance (maturity payments received on life insurance and lump-sum compensation for injury), legal damage (excluding alimony), lottery prizes, inheritance received, withdrawal from saving and sale of household durable goods and personal effects.

6.7 Domestic Expenditure:- refers to total expenditure on food, drinks, tobacco, fuel and light (energy), water, laundry and cleaning materials and the like, clothing, footwear, textiles and jewellery, transportation, communication, medical cost, payments for durable items of personal use and durable household items, reading and recreation, house rent and repairs and other household expenditures.

6.8 Payments:- refer to items under domestic expenditure plus interest paid, 'ekub' and 'edir' payments, gifts and remittance paid, deposit in bank account, insurance paid, loans given and repayment of loans made, pension and other contributions and donations, income tax, fines and other legal expenses, purchases of lottery tickets, gambling expenses and other payments.

7. Limitations of the Data

The planning and execution of the survey and editing of the returns were carefully done to minimize various types of errors. In the initial stage a choice was made between alternative systems of measuring consumption expenditure taking into consideration the level of economic development and convenience of the type of measurement selected.

Thus, for food, drinks and tobacco the values and quantities of items actually consumed were recorded while for energy sources and water, the quantities and values of the items acquired or

obtained were collected irrespective of whether they were wholly consumed or not during the reference period. On the other hand, data on part or total payment made during the reference period with respect to other items were collected along with their quantities. As it will be observed in the tables that follow the overstatement or expenditure on energy and water can be largely attributed to the recording system selected. Other limitations of the data are mentioned under the appropriate sub-sections.

Above all seasonal variation is not taken into account as information was collected for one month only in contrast to the 1981/82 rural survey of similar nature which covered the whole year.

As the results are obtained from sample households, they are subject to sampling errors. However, at this stage sampling errors are not provided.

8. Main Result of the Survey

This report presents selected data at national level. Detailed tables at national and by type of resettlement will be provided in subsequent reports.

8.1 Household Characteristics

8.1.1 Household Size

It is expected that the effect of protracted drought and famine leads to a small household size than would be the case in rural areas where, in general, household subsistence may depend

on its size. Data from both the Rural Household Income, Consumption and Expenditure Survey (1981/82) and Household Income, Consumption and Expenditure Survey in Resettlement Areas (June 1988) reflect this clearly. Table 1 shows that three member households constituted the largest, ie., about 23% followed by 4 (21%) and 2 (17%) member households. The number of households falling under these groups was 61% of the total comprising 50% of all the members. This resulted in the overall household size of 3.75 as against 5 which was obtained from 1981/82 rural survey.

8.1.2 Age and Sex Structure

A sex ratio of 51 males and 49 females is obtained from this survey as in 1981/82.

The data in Table 1 indicate that about 44% and 3% of the population were in the 0-14 and 65 and above years age groups, respectively. The proportion of young under the age of 30 was about 65%. This is about 4% lower than the result obtained from the survey conducted in 1981/82. The proportion of population aged below 15 years and 65 years and above accounts 87% of those aged between 15-64 years. This means every 100 persons supports 87 persons. The latter is lower by 30 persons than what was obtained from the 1981/82 survey. This may be due to susceptibility to disease and death of the very young and aged which has resulted in the reduction of their number or may be due to government policy measures of resettling persons who were declared to be fit to enter labour force.

8.2 Patterns of Household Expenditure, Consumption and Payments

Table 3 shows how households are distributed by domestic expenditure and household size. Without even taking into account the change in prices the distribution pattern differs from that obtained in 1981/82 survey. In the resettlement areas 31.6% of the households were spending monthly below Birr 33 or about Birr 396 per year which is less by one-and-a quarter times of the 1981/82 rural yearly expenditure for nearly a quarter of the households. A little more of the top 25 per cent of households were spending Birr 66 and above per month or Birr 792 per year. This is also almost two times lower than that for 1981/82. In other words almost three quarter of the households representing a little above two-thirds of persons spent less than Birr 66 per month or almost Birr 792 per year. Assuming that the economic position of households is best represented by their expenditure rather than their income it is safe to conclude that resettler households were placed at a lower level than their other rural counterparts in that respect.

The distribution patterns of households by expenditure and income groups in Tables 2 and, respectively, show concentration of households and members at low income/expenditure and a spend at high incomes/expenditures. From Table 3 it can be observed that the proportions of households and members increase upto Birr 41 per month or Birr 492 per year and then decline in number of households and members except for the interrupting increases for expenditure groups of Birr 74 to 89 and Birr 154 to 185 per month. In contrast to the 1981/82 survey it should be noted that the distribution of

expenditure has a sharper peak and greater positive skewness than distribution of income. This shows that expenditure is more equitably distributed than income. On the other hand, according to Tables 4 and 5, the number of households in each receipt group is almost equal to the number in the corresponding payment group. This indicates that resettlers were encouraged to spend almost all what they got from various sources.

Tables 6 and 7 provide distributions of households by income and domestic expenditure and receipt and total payments groups, respectively. Table 6 shows that the number of households who spent what they earned and who spent less than what they earned were 44.1% and 44.5%, respectively. Their share in the total income were 38.6% and 50.6%, respectively. On the other hand, 11.4% of households who had 10.5% of the total income lived beyond their means. In general 55.5% of resettler households were not saving at all. Although the proportion of households who spent what they earned is not significantly different from that of 1981/82 rural survey the latter exceeds by 26.4 percentage points when taking into account those who spent more than what they earned. This reflects that compared to the result of 1981/82 rural survey the resettlers had relatively low intention of understating their income.

It is generally believed that households in resettlement areas depend mostly on donations for their survival. However, these constituted only 8.8% of their total receipt which indicates the efforts made by them to be self-supporting. On the other hand,

it seems that settlers were induced to be "spendthrifts". Table 7 shows that 70.9% of all households spent what they got from various sources and had a share of 64.3% of the total receipt. Adding to this those who spent even more than what they got the proportions rise to 85.6% and 77.9%, respectively. The aggregate figure for households is high only by 2.2 percentage points when compared to the result of the 1981/82 survey. But the breakdowns give more information than this because in the latter 31.5% constituted those who spent more than they received. In other words in comparison to 1981/82 survey result extra financial needs could hardly be made available to large number of resettlers either from past savings or from remittance, gifts and other similar sources, thus confirming earlier statements. In addition understatement of receipt is low in resettlement areas as compared to the rest of the rural area.

Comparing the distributions of households by income and domestic expenditure and by receipt and payment groups in Tables 6 and 7 a major decline has occurred in the latter in the percentage of saving units and a slight increase in the number of those who spent more thereby contributing significantly to the number of households who spent what they had received. On the other hand, Tables 8 and 9 show that the proportions of receipts received and spent and which induced more spending are higher than that of income by 28.8 percentage points. Of this 25.7 percentage points are attributed to the former, viz, receipts received and spent.

Table 11 shows that total expenditure per household and per person stood at Birr 67 and Birr 18 per month, respectively. These

are 41% and 55% of their respective 1981/82 rural figures. If we take per household and per person expenditures as a measure of standard of living the resettlers were at a lower level than the non-resettlers.

Of the average disbursement per person per month about 86% was allocated for consumption expenditure and the rest for other disbursements. Consumption expenditures among low expenditure groups were not out of proportion to their incomes. In general, it is in the higher expenditure groups of Birr 138 and above per month that consumption expenditures were disproportionate to income. In other words, there was a tendency for expenditure to fall short of income at low expenditures, and to exceed income at the very top expenditure levels; the almost uniform tendency for the ratio of consumption to income to be higher, the higher the expenditure. Thus as the expenditure tends to increase, the average propensity to consume tends to increase in general. As in the result of 1981/82 rural survey the usual phenomenon of finding negative savings among lower income groups and a successively larger savings fraction of income among higher income groups is observed when computing the ratio of per capita consumption to per capita income using data provided in Table 2, 8 and 12. Thus above Birr 66 per month the average propensity to save varied between 3% and 60%. The lower and upper limits are higher by 2 and 20 percentage points, respectively, than those obtained in 1981/82.

Consumption expenditure on food, drinks and tobacco had in general an inverse relationship with increase in expenditure.

However, expenditure incurred on clothing and footwear had an increasing proportion of total expenditure with increase in expenditure. The other major expenditure component was housing consisting of purchase of housing, construction, repair, building materials, energy and water. Of these items energy took the major share, 23% of the total consumption expenditure.

It can be seen from Table 11 that if you exclude the non-consumption items the share of food in total expenditure was 54%. This is only 3 percentage points lower than the result obtained for the rural area in 1981/82. In contrast to the result of the 1981/82 survey a declining proportion of its expenditure was being devoted to food which decreased from 70% to 15% except for one or two expenditure groups. However, care must be exercised in drawing conclusions about the changes in standard of living of the household with increased expenditure in as far as the households are in similar situation. In Table 10 of the total consumption expenditure cereals, pulses, oilseeds, fruits and vegetables, spices, meat and dairy produce constituted 28%, 5%, 1%, 3%, 5%, 1% and 2%, respectively. The consumption of stimulants, namely, 'chat' and tobacco, was about 1%. On the other hand, drinks and drink constituents constituted a little above 4%. Using the Food Composition Table for use in Ethiopia by Gunnar Agren, and Rosalind Gibson, 1968, Expanded Food Composition Table for Use in Ethiopia, Ethiopian Nutrition Institute and other unpublished sources, the total calorie per person per day is roughly calculated at about 2,338. As opposed to various comparisons in terms of monetary terms this is only 11% lower than the 1981/82 rural figure. If we break the total calorie into major component groups

88% and 6% were obtained from cereals and pulses, respectively. Of this cereals, oilseeds, fruits and vegetables and spices contributed each with less than one percent of the total calorie. Dairy produce contributed a little above 1%. The share of cereals in the total calorie is higher by 14 percentage points when compared with that of 1981/82 figure.

8.3 Patterns of Household Income and Receipts

In the preceding sub-section one of the measures of economic position of the household has been presented. But it should be noted that in as much as the extent of buying power and the actual level of consumption are highly correlated it becomes difficult in most cases to discuss one of them in isolation without mentioning the other. Thus more has been said on income and receipts in the previous sub-section. In what follows additional points have been raised with respect to income and receipts.

Table 2 shows that about half of the households were in the income groups below Birr 49 per month, followed by the next largest number of households (42%) in the income groups Birr 50 to 121. Only 8.4% of the households had income Birr 122 and above per month. Using data in Tables 2 and 8 if the households are arranged in the ascending order of income, a little above the bottom 10% of households, i.e., 11.9%, receive only 3.5% of total income, whereas a little above the top 10% of households, i.e., 12%, receive almost 32% of total income.

Tables 13 and 14 present income and receipts of the household by income and domestic expenditure groups. Even considering the small amount of donation from government and other similar sources as receipt the first observable pattern is that there is no marked difference between income and receipt for the resettler household. In other words about 90% of total receipt was derived from household income and 10% from other sources. This indicates that in general resettlers have started to depend more on their earned income rather than on gifts, donations and other types of transfer income. Thus the monthly per household and per person income were Birr 64 and Birr 17, respectively, while the corresponding receipt figures were Birr 65 and Birr 17. However, these are about 46% and 61% of their respective values obtained from 1981/82 rural survey. Thus the non-resettlers were better off than resettlers.

Based on data in Table 11 and per capita income calculated from Tables 3 and 8 household income information among upper expenditure groups, viz, Birr 138-153, 186-217, 218-281 and 282 and above was found to be understated. It seems that some of the sources of income were of a kind that the higher expenditure group households were not prepared to reveal or the households might have under-reported due to failure to recall. In addition in order to cover their excess expenditures households among higher expenditure groups might have resorted to deficit financing through receipts of gifts, loans and other transfer receipts. On the other hand, using data in Tables 2 and 8 to calculate per capita income by income group and then using along with the result in Table 12 to calculate the ratio of per capita

consumption to per capita income we obtain average propensity to consume ranging from 40% to 97%. This gives an indication of the proportions of income spent by the upper income group households. On the overall the proportion of income consumed was 89%.

It is observed that the per capita income increases with the average income of the household. The ratio of the per capita income for the lower expenditure group to the upper expenditure group was about 1:8 for non-resettlers (1981/82 survey); and 1:6 for resettlers. This shows that the gap between lower and higher expenditure group was more or less maintained in the two surveys.

Except for income levels of Birr 58 to 65 and Birr 106 to 153 for which the household sizes declined while per capita income continued to increase the increase in household size was directly related to the increase in per capita income for the other income groups. Large number of declining household sizes with increasing income per household are observed when household sizes are calculated by expenditure groups. In both cases the average size of households in the lower income groups is smaller than in the higher income groups. However, it seems there is some relationship between size of household and household income as revealed by the 1981/82 rural survey.

8.4 Transactions in Donated Items

Eventhough donations constituted only 8.8% of the total receipt per person households were asked whether or not they had transacted in donated items during the reference month. Those households, about 3%, which responded in the affirmative were again asked for reasons of selling donated items. Of the reporting households 93% sold donated items because they preferred to buy other items even if the donated items were usable. If we add to this 4% of the households who reported that they sold donated items because they were not used to them about 97% had been involved in this type of activity.

On the other hand, households were asked whether or not they had purchased items during the reference month using money obtained by selling donated items in and outside the reference month. Those who responded 'yes', viz. 5%, were again asked for reasons of purchasing those items. About 68% of them said that the item purchased was not included in the items donated. Another 8% of them said that the item purchased was included in the items donated but it was inadequate. The rest of the households which constituted about 24% gave various reasons.

In general the number of households involved in selling donated items is very insignificant.

9. Conclusion

A single month's income and expenditure distribution may be questioned in its usefulness for inter-area comparison. Also the first thing to be noticed is that the date of reference of data for the resettlement area is quite recent from that of the rest of the rural area. Both perhaps diminish the significance of the comparison. However, the present study may be considered as a first attempt towards and empirical analysis of the distribution of income and expenditure as well as consumption in resettlement area. It is by no means an exhaustive study but the results are of considerable academic interest and significant for policy decisions.
