APPENDIX 1 - LOCAL MEASUREMENT UNITS OF AREA BY WEREDAS	
APPENDIX 2 - DENSITY OF VARIOUS CROPS IN GRAMS/C.C.	
APPENDIX 3 - SURVEY DATES IN THE PROVINCES (N.S.S. 2nd ROUND)	
APPENDIX 4 - NATIONAL SAMPLE SURVEY, SECOND ROUND, SCHEDULES 7, 8, 11 & 12.	

INTRODUCTION

During the second round National Sample Survey attempts were made through objective measurements to determine the sizes of Area and production units in terms of standard units like hectares and litres or kilograms respectively.

The survey in which one percent sample of rural households were interviewed covered thirteen provinces. In this survey 162 different local area units and 252 agricultural production units were reported by the farming households. Both for the area and production units an attempt has been made to write phonetically their names in Amharic and English.

For area calibrations the fields of one third of the sample households were actually measured with the help of chain and compass. As may be seen from the tables, there are variations in the size of any one unit from Awraja to Awraja. There are many reasons for these variations. For example, the unit "timad" is defined as an area ploughed by a team of oxen during a day's work. However, the size of the area defined as above depends on such factors as topography, weather, type of soil, hours of work, stamina of oxen and farmer etc. In the minds of the local people each area unit has similar descriptive meanings, and therefore, it will be useful to have this information in future surveys.

In this report the provincial average area of a local unit is given for all those units for which ten or more sample fields were measured in a province.

For reference purposes appendix 1 lists out by Weredas the local area units reported by the sample households.

Most local production units are volumetric in nature. Calibrations were made by the use of standard fillers and actual weighings of an ordered list of agricultural produce in one third of the sample households.¹

In some areas the names of a set of the local production units may be the same, but the ratios within the different sets of units may be quite different. In such cases the sets of units are shown separately.

¹For detailed information on the methodology and instructions on local area and production units the reader is referred to Statistical Manual 4, Addis Ababa, November 1968 - "National Sample Survey - 2nd Round" Forms and Instructions. For area units see pp. 68, 111-114. For Production units see pp. 82, 106-110.

For illustrative purposes the weights of red teff which will fill the local units of production are shown in the report. In order to find out for any given local production unit the weight in kilograms of any one of the crops listed in appendix 2, the volume of that production unit in litres from the tables is multiplied by the density figure (grams per c.c) of the crop. For example, the weight of one "dawla" of white teff in Aseko Wereda of Arba Gugu Awraja in Arussi province will work out to be $140.27 \times 0.852 = 119.51$ kilograms.

Production units with "1" written against them are used for honey, white units with "2" are used for unhulled dried coffee beans, and "3" are for cotton. All the rest of the units are for measuring grains and pulses.
