# S E C T I O N 1

## INTRODUCTION

It is widely recognized that planning and realistic formulation of policies are inconceivable without the objective assessment of the prevailing socio-economic conditions of the country. In recognition of this fact, the Central Statistical Office has conducted limited socio-economic and demographic surveys and the results of which constituted the principal source of information upon which planners depended in assessing the socio-economic conditions of the country and for drawing up development programmes. The Office in its further effort in up-dating and filling statistical gaps in data requirements, carried out Manpower and Housing Survey in seventeen major towns between May and August 1978

However, it must at the outset be acknowledged of the long-time lag between the completion of the enumeration and the publication of the survey results. The main bottlenecks were the correcting of errors introduced in data collection, editing and coding and that problems faced in the processing of the data. It was also subjected to further delays in the course of the preparation of summary tables.

This publication presents the results of the survey in five sections.

Section I - is an introductory section dealing with review of population data in urban areas, objectives and organization of the survey etc.

Section II - deals with the characteristics of the population such as age sex distribution, distribution of population by literacy, educational attainment, place of birth, economic activity etc.

Section III - is devoted to characteristics of the employed population. The characteristics include age-sex distribution, educational attainment, marital status, occupation, industry, number of days and number of hours worked ...etc.

Section IV - it presents the housing characteristics and household income of the towns. This include housing stock, type of housing, housing facilities, rental value, distribution and source of household income.

Section V - presents the sample design, estimating formula, and estimates of relative standard errors for selected population parameters.

## I. REVIEW OF URBAN POPULATION DATA

### a) Source of Data

Prior to 1960's systematic population censuses and sample surveys have not been carried out in the urban and the rural areas of the country. As a result, data on population estimates for urban areas were of limited nature until the Central Statistical Office launched the National Sample Surveys I and II Round in the 1960's and early 1970's, respectively.

The National Sample Surveys I and II Round covered the urban and the rural areas of the country. In the National Sample Survey I Round (1964 - 1968) 195 towns representing 92% of the urban population have been covered. Result of this survey was published in ten separate town reports and in a report entitled Survey of Major Towns in Ethiopia, 1968<sup>1</sup>. This report, however, in addition to the 195 towns covered in the survey presents population estimates for other 53 towns giving a total of 248 towns. The estimates of the 53 towns were based on the 1956 and 1962 population estimates of the Ministry of Interior and on estimates made by the Geography Department of Addis Ababa University.

In the Urban Population and Housing Sample Survey II Round (1969 - 1971) 91 towns, that constitute 37 percent of the total urban population, have been covered. The result of this survey was published in Tables of Demographic Data for 91 towns.<sup>2</sup> A systematic analysis of the result of this survey was made and published in Analysis of Demographic Data of Urban Areas Covered during Urban Survey, II Round, 1969 - 1971<sup>3</sup>. In addition resulting demographic and housing data from urban surveys first and second round have been explicitly treated in Urbanization in Ethiopia, 1972<sup>4</sup>. Moreover, Central Statistical Office is undertaking experimental studies on setting up vital statistics registration system since 1977 in selected towns (Addis Ababa, Adis Alem and Sheno) and in limited Farmer's Association areas. The base population of this study is published in Base Population for Experimental Vital Statistics Registration<sup>5</sup>. This experimental study was extended, in March - August 1979, to towns of Ambo, Fitcha, Meki and Debre Brehan. Population estimates of these towns based on this study is available and will soon be published.

However, of all the towns, Addis Ababa was the object of successive studies of varying quality. The first census was conducted in September 1961, results of which was published in Population of Addis Ababa, 1961<sup>6</sup>. The second census of Addis Ababa was conducted in 1967 and was published in Population of Addis Ababa, 1967<sup>7</sup>. This was followed by Manpower and Housing Sample Survey in 1976, where detailed data on the characteristics of the population, the employed, the unemployed labour force and housing have been collected and presented in a publication entitled Addis Ababa Manpower and Housing Sample Survey, December 1976<sup>8</sup>. Moreover, population estimate for the city is available from the Housing Census carried out by the Ministry of Urban Development and Housing in August 1978. This was followed by demographic sample survey which was carried out in September 1978 as a joint venture by the Central Statistical Office, Ministry of Urban Development and Housing and the Municipality of Addis Ababa. Detailed tables of this survey and systematic analysis of the data are published in REPORT ON THE ANALYSIS OF THE ADDIS ABABA DEMOGRAPHIC SURVEY,

SEPTEMBER 1978<sup>9</sup>. In Dire Dawa in addition to the survey of August 1965 (National Sample Survey I Round) and August 1970 (National Sample Survey II Round) conducted by Central Statistical Office, the Ministry of Labour and Social Affairs carried out Manpower and Household Survey in May 1976. The results of the survey have been issued in the publication entitled the Report on the Household Manpower Survey in Dire Dawa, May 1976<sup>10</sup>. Dire Dawa was also covered in the Manpower and Housing Sample Survey conducted between April - July 1978.

Similarly, demographic data are available for Asmara based on repeated surveys while Eritrea was an Italian colony. Asmara also had its population estimated by the British Military Administration<sup>11</sup>. However, the first systematic study undertaken by Central Statistical Office was in 1963. The first census, however, was conducted in 1968, the content and design of which was the same as of the 1967 census of Addis Ababa. The result of the census was analysed and published in POPULATION AND HOUSING CHARACTERISTICS OF ASMARA, 1968<sup>12</sup>.

b) Urban Population Estimates and Projections:

Projections of urban population (for 1980 and 1985), by region, are made based on population data from N.S.S. I and II rounds, estimates from urban dwellers association areas, estimates from the Ministry of Interior, etc. is available. The projections are made on the basis of the observed annual rate of population growth by size class of towns<sup>13</sup>. The number of towns (with a population of 2,000 and over) included in the projections are 255 and the distribution of the towns by region are as follows:-

<u>Region</u>	<u>Number of Towns</u>	<u>Region</u>	<u>Number of Towns</u>
Arasi	14	Illubabor	10
Bale	7	Kefa	13
Gondar	13	Shewa	51
Eritrea	23	Sidamo	22
Gamo Gofa	6	Tigray	18
Gojam	21	Wellega	20
Hararge	22	Wello	15

According to the projections the urban population for January 1980 is approximately 4.1 million and for January 1985 it is approximately 5.4 million; These constitute 13.6% and 15.6% of the total population, for the period 1980 and 1985, respectively. It indicated an increase of 0.4 percentage point per annum.

c) Population Data Required for Urban Development Planning -

Till now urban development planning was based on the sources of the data discussed above. These data are, however, inadequate and out-dated. The current trends in town planning emphasize the great importance on more reliable, adequate and up to date statistical information. These information include population/<sup>age</sup>sex structure and other characteristics such as employment structure; size of employed and their characteristics, size of unemployed and their characteristics, income distribution of urban households, income distribution of employed labour force, population per housing unit, household per housing unit, rental distribution and association or correlation of rental distribution and income distribution, housing stock, type of housing, break down of housing on the basis of residential and non-residential housing, and housing facilities. The Manpower and Housing Sample Survey has taken account of these requirements.

Following the Manpower and Housing Sample Survey of Addis Ababa, December 1976 and of Nazereth December 1977, similar survey was carried out in sixteen other major towns between May and August 1978, using slightly revised schedule. The towns covered in this survey are Gondar, Bahir Dar, Mekelle, Dessie, Debre Brehan, Debre Zeit, Nekemt, Akaki, Jimma, Metu, Arba Minch, Awassa, Harar, Dire Dawa, Goba and Assella.

II. OBJECTIVES OF THE SURVEY.

The major objectives of this survey are:

- a. To determine size and age - sex structure of the population and thereby annual growth rates of population between this and the previous surveys required for population projections.

- b. To provide an indication in the size, sectoral and occupational distribution of total urban employment which could be used together with similar surveys in future to determine trends and employment projections and which would help in the formulation policies.
- c. To provide data on the differences in size and rate of unemployment between the towns and serve as an indicator of urban unemployment.
- d. To enable the determination of demographic measures such as fertility, mortality and migration rates.
- e. To determine the size of housing stock and assess conditions and availability of housing facilities.

Thus in light of the above objectives, measures of indicators computed from the statistical information of this survey will undoubtedly serve as a theoretical frame work in an attempt to define urban population policy, employment and unemployment policy, and to ensure utilization of urban human resources.

### III. ORGANIZATION OF THE SURVEY

#### a) Training and Manpower Deployment

Regular field supervisors and enumerators were trained in the fourth week of April 1978. and the training was held at the Head Office by staff members of the Central Statistical Office. The training included classroom discussion of how to complete the listing form and the enumeration schedule. The instruction manuals for the listing form and the questionnaire was thoroughly discussed. In addition they were given instructions on how to select the households to be interviewed.

Eight teams of field staff were deployed for the survey, a team consisted of 5 enumerators and 1 supervisor. A team was assigned to complete two towns. The selected enumeration areas were equally divided among the enumerators and each enumerator was assigned to two enumeration

areas that were as close as possible to each other. The arrangement was such that an enumerator was to complete listing and sample enumeration before proceeding to the next one. Then field work started during the first week of May 1978 and was completed in the third week of August 1978. The enumeration of a selected enumeration area (E.A.) in a town took roughly thirty to forty five days. In a few towns where the E.A.'s selected were large in terms of area as well as in number of households to be interviewed, it took longer time to complete the enumeration. Further the problems of call-backs has contributed to the delay.

In September 1978 coding and editing instructions were prepared and the coders and the editors were trained for a week. Coding and editing of the data took nearly two and half months. Punching of the data followed and was finished in an other two months time. Finally, the required tables have been produced.

b) Contents of the Survey

The statistical information regarding every member of the household was recorded by enumerators who canvassed the selected households in the sampled enumeration area using the manpower and housing survey questionnaire attached in the appendix. The survey collected the following detailed information:-

1. For all persons:- Age, sex, residence status, relationship to the head of household, marital status, length of continuous residence in the town, place of birth, mother tongue and survival of parents.
2. For persons aged ten years and over:- Literacy status, highest grade completed, type of education, number of days worked last week, reason for not working at all or for working less than two days during the reference period.

3. For females 12 years and over:- Number of children ever born classified by now at home, now elsewhere and now dead; children born during the last 12 months classified by now alive, now dead; and duration of marriage for currently married women.
4. For employed members of the household:- Information has been collected on occupation, employment status, industry, number of hours worked last week and income earned last month.
5. For unemployed members of the household:- Information has been collected on duration of unemployment, whether previously employed or not, action taken to find a job and means of earning livelihood now.
6. For those now unemployed but previously employed:- Information on previous occupation, employment status and industry was collected.
7. For all households:- Deaths to members in the last 12 months classified by age and sex, household income by source, and possession of radio, telephone and T.V. sets.
8. Housing Data:- Housing characteristics was asked for each housing unit dwelt by the selected household. If two or more households lived in the same housing unit, the housing unit information was entered for only one of the households. The following housing information was collected regarding each housing unit selected: type of housing unit, type of tenure, monthly rent, number of households in the housing unit, and number of persons in the housing unit. Regarding the material of construction - questions were asked on the type of roof, ceiling, floor and wall. Besides, availability of water, lighting, toilet and kitchen facilities were asked.

c ) Concepts and Definitions.

1. Household: A household is defined to constitute of a person or group of persons, irrespective of whether related or not, who normally live together in the same housing unit or group of housing units within a premise and who have common cooking arrangements. Domestic workers (cooks, baby sitters, guards, gardeners ....etc.) who are living together and sharing meals with the household they serve are considered members of that household. A lodger or a person who occupied a separate room in a house and prepared his own meal or cared for himself is considered as a separate household. Thus a housing unit or a dwelling can be occupied by one or more than one household and similarly a household can occupy more than one housing unit.

A person is considered a member of a household if he usually lives and shares meals in the household. He may either be present or absent during the survey week, however, if a person has been away from the household for six or more months he is not considered as a member of the household.

2. Housing Unit: It is a structurally separate and independent place to live in. The word separate means that it is separate by walls from its surroundings or from other housing units. The word independent means that the occupants can come in and go out of their living quarters without having to go through any body else's quarters. Thus in this survey the housing characteristics were collected for housing units that were used only for dwelling purposes and for housing units which were used for dual-purposes (for dwelling as well as for carrying out economic activities, that is, where articles are made or repaired for sale or exchange, or articles are sold without any transformations).
3. Highest grade completed: This included the completion of grade 1 to Grade 12, University completed and University Incomplete which

are self explanatory . However, this concept also included post secondary which means the completion of technical and vocational training institutions that are of higher level than the senior secondary.

#### 4. Economically Active and Economically Non-Active Population?

4.1 Economically active constitute the employed and the unemployed persons ten years and over.

i) Employed persons constitute the following categories:

Employed at work - Persons (employers, employees, self employed) who during the survey week, worked two or more days for pay or profit.

With job but not at work - Persons who having already worked in their present job, were temporarily absent during the survey week. They are those on job leave due to illness, vacation etc.

Unpaid family workers - Persons who worked two days or more during the survey week for no pay in a family operated business by the head or any member of the household.

ii) Unemployed Persons - Unemployed are those persons who did not work during the survey week or worked only one day. They may have either been active looking for a job, that is, made efforts to find one or were passively unemployed because they thought jobs were not available. Unemployed persons constitute those who have been employed previously and those who have not been employed previously.

4.2 Economically Non-Active Population - Constitutes the following persons; Those who are ten years and over who are students, home-makers, unearned income recipients, physically disabled, prostitutes, pensioners and those unable to work due to old age.

5. Industry and Occupation of Economically Active Population:

5.1 Occupation - The occupation of an economically active person is the person's profession or the kind of work the person does in the establishment or the enterprise he works. That is, the occupation in which the person spends most of his working time. The occupation of employed persons is classified in broad occupational categories (see International Classification of Occupations, ISCO).

5.2 Industry - Every person who has an occupation can be classified under an industry. Industry means the field of economic activity or the branch of the economy in which the person is working or last worked if now on job leave or unemployed. It is usually the activity of the establishment in which a person works or last worked. The activity of the establishment refers to the actual output or the service rendered by the establishment (see International Classification of Industries, ISCI).

6. Income.

6.1 Income for Employed member of the household. income refers as monthly earnings generated from one or more of the following sources; wages, salaries, housing compensation allowance, property (Interest on bank saving, return from share holding, return from sale or rent of property) and net profit from household business.

6.2 Household Income - is defined as the total monthly earning of each and every member of the household added up together from the following sources; wages, or salaries from employment, housing compensation allowance, pension remittances, property (Interest on bank saving, return from shareholding, return from sale or rent of property), and net profit from household business.

7. Fertility and Mortality:

- 7.1 Crude birth rate - The number of births which occur during one year per 1,000 persons.
- 7.2 General fertility rate - The number of births that occur during one year per 1,000 women aged 15 - 49.
- 7.3 Total fertility rate - The number of children that would be borne by a group of women aged 15 - 49 under a given age - specific birth rates. It is usually expressed as rate per woman.
- 7.4 Gross reproduction rate - The number of daughters that would be borne by a group of women aged 15 - 49 under a given age-specific birth rate. It is usually expressed as rate per woman.
- 7.5 Crude death rate - The number of deaths that occur during one year per 1,000 persons.

d) Towns covered in the survey.

Towns covered and dates of survey

<u>Town</u>	<u>Date</u>	
Arba Minch .....	May	1978
Awassa .....	July	1978
Assella .....	June	1978
Bahir Dar .....	July	1978
Akaki .....	July	1978
Nekemt .....	July	1978
Dire Dawa .....	July	1978
Goba .....	July	1978
Debre Berhan .....	July	1978
Metu .....	June	1978
Harar .....	June	1978
Jimma .....	May	1978
	July	1978

Towns covered and dates of survey (contd.)

<u>Town</u>	<u>Date</u>
Debre Zeit .....	June 1978
Mekele .....	June 1978
Dessie .....	August 1978
Gondar .....	May 1978
Nazereth .....	December 1977

e) Cost of Enumeration - In the survey a total of 11,905 households have been covered and the total cost incurred for the enumeration was 40,315 Birr. This constituted 29,252 Birr for per diem, 10,468 Birr for fuel and 595 Birr for other cost. This cost does not include the salary of the Central Statistical Office staff members involved in the survey. Further, substantial resources have been expended for the processing, compilation, printing...etc. of the survey results.

IV. ABREVIATIONS.

N.S. = Not stated.

N.E.C. = Not elsewhere classified.

N.S.S.I. = National Sample Survey First Round.

N.S.S.II. = National Sample Survey Second Round.

Note that the proportions employed and unemployed add up to 100 percent.

1. The coefficient of variations for the unemployed in this survey ranges from about 16-63%, which means an indication of high error in the estimation of the unemployed. Further, the magnitude of the unemployment is relatively low for all the towns compared with the result of the 1976 manpower survey of Addis Ababa, which was about 10 percent. Hence, one should be cautious in utilizing the unemployment data given in this Table.

NB The number of renting households and the total monthly rent paid by renting households given in this Table are less than those given in other Tables for in the other Tables imputed rent of non-rented houses was included.

SECTION V

Sample Design and Estimation.

SAMPLE DESIGN.

A two stage cluster sampling was adopted in every urban centre that was covered by the survey: the first stage being the selection of enumeration areas\* and the second stage being the selection of households within selected enumeration areas. Taking into consideration the available time and resources, it was decided to select the following number of enumeration areas and households, and their distribution is as follows:

Distribution of Sampled Enumeration Areas and Households by  
Urban Centres

SR. NO.	URBAN CENTRE	SAMPLED NUMBER OF	
		ENUMERATION AREAS	HOUSEHOLDS
1	Assella	29	580
2	Gondar	19	1,166
3	Metu	25	482
4	Harar	26	627
5	Goba	25	500
6	Mekelle	16	1,024
7	Akaki	19	380
8	Awassa	25	481
9	Arba Minch	15	350
10	Nekemete	31	604
11	Jimma	23	1,011
12	Debre Birhan	30	600
13	Dessie	22	1,044
14	Debre Zeit	16	1,030
15	Dire Dawa	32	1,157
16	Bahir Dar	18	1,087
17	Nazereth	44	1,062

\* Each of the surveyed urban centre was divided into enumeration areas in 1974-75.

To overcome possible effects due to variation in sizes, enumeration areas were selected with probability proportional to size, size being the number of housing units estimated during delineation of enumeration areas.

Estimation.

Based on the sample design outlined, the following formula has been used to estimate population characteristics (separately for each of the surveyed urban centres.)

$$\hat{Y}_u = \sum_{i=1}^{n_u} \frac{H_{ui}}{n_u P_{ui} h_{ui}} \sum_{j=1}^{h_{ui}} Y_{uij}$$

$$= \sum_{i=1}^{n_u} \frac{\hat{Y}_{ui}}{n_u}$$

Where:-

$Y_{uij}$  = characteristic Y observed on the  $j^{\text{th}}$  selected household in the  $i^{\text{th}}$  selected enumeration area from urban centre "U".

$H_{ui}$  = listed number of households of the  $i^{\text{th}}$  selected enumeration area from urban centre "U".

$n_u$  = total number of enumeration areas selected from urban centre "U"

$h_{ui}$  = selected number of households from the  $i^{\text{th}}$  selected enumeration area of urban centre "U".

$P_{ui}$  = the probability of selecting the  $i^{\text{th}}$  enumeration area from urban centre "U"

$$\hat{Y}_{ui} = \frac{H_{ui}}{P_{ui} h_{ui}} \sum_{j=1}^{h_{ui}} Y_{uij}$$

$\hat{Y}_u$  = estimator of the population value of the Y characteristic based on all sampled households of urban centre "U".

## Sampling Error Estimates.

Estimates of the various population characteristics have been generated from the sampled households, and are therefore, subjected to sampling variations. The magnitude of the sampling variations are measured by the sampling error. Sampling error is a measure of deviation of the sample estimate from the population value estimate that could have been derived by complete enumeration using the same definition and procedures. In other words, sampling error measures how closely results obtained from a sample correspond to the results which would have been obtained if a complete count had been taken.

To assess the magnitude of sampling errors of various characteristics, the following formula has been adopted.

$$\hat{V}(\hat{Y}_u) = \frac{\sum_{i=1}^{n_u} (\hat{Y}_{ui} - \hat{Y}_u)^2}{n_u (n_u - 1)}$$

where  $\hat{V}(\hat{Y}_u)$  is the estimator of the sampling error (variance) of the estimate  $\hat{Y}_u$ .

More often, coefficient of variation (c.o.v.) sometimes called relative standard error, is used in the assessment of the reliability of estimates. The ratio of the standard error (the square root of the sampling error) to the value being estimated is called coefficient of variation. One could say that an estimate is satisfactory (more or less reliable) if its coefficient of variation is small.

Table of coefficient of variation for selected characteristics is given at the end of this section.

As can be observed from the table, for example, the population of Gonder is estimated to be 58,359 with 5.5% coefficient of variation. Because of the presence of sampling error, we can say with 95% confidence that the population of Gonder will be within the range of  $58,359 \pm 2(599)$  (that is between 57,161 and 59,557) and with 99% confidence, the population size would be within the range of  $58,359 \pm 3(599)$ . Like wise, similar interpretation can be made with the remaining estimates of characteristics.

It has to be noted that the adoption of a household as a unit of enumeration in the collection of data on housing characteristics has made it necessary to adjust household multipliers in estimating housing characteristics at data processing stage for cases were found in which more than one household resides in a housing unit.

The adjustment made on household multipliers to estimate housing characteristics could result in inconsistencies of results when relating household and housing characteristics as well may affect precision of estimates of housing characteristics.
