Statistical data that reflect the socio-economic and demographic conditions of the residents of a country are useful for designing and preparation of development plans and for monitoring and evaluation of the impact of the implementation of the development plans. These statistical data include population size, age, sex, fertility, mortality, migration, literacy and education, marital status, occupation, industry, housing stocks and conditions, ...etc. In order to fill the gap for these Socio-economic and demographic data need, Ethiopia conducted its second National Population and Housing Census in October, 1994.

The 1994 Population and Housing Census of Ethiopia was conducted under the auspices of the Population and Housing Census Commission that was set up under Proclamation No. 32/1992. The Commission was chaired by the Prime Minister and the members of the commission were drawn from various relevant ministries. The Central Statistical Authority served as the Office of the Commission (Secretariat). Hence the processing, evaluation and analyses of the data collected in this census as well as its dissemination are the responsibilities of this office. As stated above the census was conducted in October 1994 and the resulting data are processed and evaluated. Volume I of the census report presents the Statistical Reports for Oromiya Region which appear in six separate parts:

Volume I: Part I - Statistical Report on Population Size and Characteristics.
Volume I: Part II - Statistical Report on Education and Economic Activity.
Volume I: Part III- Statistical Report on Migration, Fertility and Mortality.
Volume I: Part IV - Statistical Report on Housing Characteristics.
Volume I: Part V - Abridged Statistical Report.
Volume I: Part VI - Statistical Report on Population Size of Kebeles.

Thus, the Office of the Population and Housing Census Commission is pleased to present the census report "The 1994 Population and Housing Census of Ethiopia: Results for Oromiya Region, Volume I: Part III - Statistical Report on Migration, Fertility and Mortality" for users. Another report which deals with the detailed analysis of the results of the 1994 Population and Housing Census data for Oromiya Region will also be produced soon.

The 1994 Population and Housing Census was a huge nation wide operation which could not be undertaken by a single organization. Thus, full cooperation and assistance of government and non- government organizations, external donor agencies and the public in general was obtained. A number of preparatory activities were also carried-out before the census enumeration was begun. Among the major census preparatory activities was the conduct of the Population and Housing Census Map Work. In the census map work the peasant associations in rural areas and the urban dwellers associations in urban areas were sub-divided into enumeration areas with 150-200 housing units in urban areas and 150-200 households in rural areas. About 5-6 contiguous enumeration areas were formed into one supervision area. In this exercise enumeration area and supervision area maps were also prepared. In the census map work operation a total of 49,978 enumeration areas and 9,845 supervision areas were constructed in the settled rural areas and 8,724 enumeration areas and 1,575 supervision areas in the urban areas of the country. In rural areas of Oromiya Region a total of 19,143 enumeration areas and 3,814 supervision areas were delineated. On the other hand, in the urban areas of the region, a total of 2,457 enumeration areas and 443 supervision areas were formed.

During the census enumeration, one enumerator was given the map of one enumeration area and was responsible to record all persons and housing units in that enumeration area. One supervisor was later assigned to a supervision area and was responsible for the quality of the information collected in that area.

The Office of the Population and Housing Census Commission would like to thank all government and non-government agencies who participated in the organization of the census, the supervision of the field work, the data collection, and the respondents who participated in providing the necessary information. The government of Ethiopia has given huge financial and unreserved administrative support in undertaking the 1994 National Population and Housing Census from its inception till the dissemination of the results. This indicates the commitment and high priority offered by the government for socio-economic and demographic data collection, processing, evaluation and dissemination of the results to users.

The Office would also like to take this opportunity to express its many thanks to the United Nations Population Fund (UNFPA) to its generous financial assistance and technical support in conducting the census. Moreover, thanks are due to United States Agency for International Development (USAID) for its financial and technical assistance for the census. Further thanks are due to the United Nations Development Program (UNDP) and to the Swedish International Development Authority (SIDA) for their financial assistance. The office hopes that the data presented in this report will be found useful by all data users.

CHAPTER I

INTRODUCTION

This chapter presents an overview of the content of the census report " The 1994 Population and Housing Census of Ethiopia: Results for Oromiya Region, Volume I: Part III - Statistical Report on Migration, Fertility and Mortality " This report presents information on migration (migration status and length of residence), fertility levels and mortality conditions of the population. Summaries of population sizes (for zones, weredas, and towns; and projected population figures up to the year 2000) are also presented as an Annex. The data presented in this report constitute some of the major statistical tables that are essential to planners, administrators, researchers and other data users. The analytical report of the results of the census for Oromiya Region will be presented in a separate report, and will deal with indepth analyses of the results. Other reports that also present information for Oromiya Region are: Volume I: Part I- Statistical Report on Population Size and Characteristics; Volume I: Part II- Statistical Report on Education and Economic Characteristics; Volume I: Part IV- Statistical Report on Housing Characteristics; Volume I: Part V- Abridged Statistical Report and Volume I: Part VI Statistical Report on Population Size of Kebeles.

Oromiya Region consists of twelve zones, 180 weredas and 375 towns. The rural parts of the region had 10,161 farmers' association areas at the time of the census. However, this number has recently declined drastically after the reorganization of the rural kebeles. The urban parts of the region have 564 kebeles in the 375 towns. The census fully covered most of the areas in the region except for 97 farmers' associations in the rural areas and 4 kebeles in the urban areas. The areas that were not covered in the census are in Misrak Harerge Zone, Borena Zone, and Mirab Harerge Zone. Out of the 180 weredas in the region, 165 weredas were fully covered. In 14 weredas some FAs or urban kebeles were not covered in the census while in one wereda (Jarso wereda of Misrak Harerge Zone) the entire FAs (that number 30) and its town(Ejersa Goro) were not covered. These weredas were: Kombolcha, Babile, Fedis, Haro Maya, Kurfa Chele, Kersa, Malka Balo, Bedeno, Girawa, and Gola Odana Meyumuluke weredas in Misrak Harerge zone; Arero and Moyale weredas of Borena Zone;

Mieso and Darolebu weredas of Mirab Harerge Zone. The kebeles that were not covered in the census were: a kebele in Ejersa Goro Town (i.e the whole town) of Jarso Wereda; a kebele in Mulu Town (i.e the whole town) of Mieso Wereda; parts of kebele 01 and parts of kebele 02 in Moyale Town of Moyale Wereda. For details concerning the farmers' associations not covered in the census, reference may be made to Table 7.2 Volume I: Part VI.

The statistical tables presented in this report all refer to the areas that were covered during the census only, except in a few cases where it is explicitly stated that estimates for the areas not covered in the census are included. In this report, the population size of the areas covered in the census plus those that were not covered in the census is presented by zones and weredas in Annex Table 1. The estimated population size of the areas not covered in the census by zones and weredas are presented in Annex Table 2, and the estimated population sizes of towns not covered in the census are presented in Annex Table 3. The population size estimates for the farmers' associations not covered in the census are presented in Table 7.2 in Volume I: Part V. The population projection for the region is prepared using the total of the census covered plus the estimated population sizes. All the other tables refer to the census covered population only. In these tables, the information for weredas that were only partly covered during the census refer to the census covered population only. Jarso wereda will not appear in any of these tables because it was not covered during the census.

Localities were identified as towns or rural areas during the census cartographic work. Towns were defined as localities in which Urban Kebele Administration (previously known as Urban Dwellers Association) has been established. Localities that had 1000 or more persons whose inhabitants were primarily engaged in non agricultural activities were identified as towns irrespective of whether Urban Kebele Administration has been established or not. Similarly capitals of weredas were also identified as towns even if Urban Kebele Administration has not been established. However, changes of wereda boundaries have occurred since the conduct of the census cartographic work; and in some instances two or more previous weredas have been combined to form one wereda. Thus, localities that were seats of wereda administration at the time

of the census cartographic work, and subsequently identified as towns in the census report, may no longer be wereda capitals.

The 1994 Population and Housing Census was the second national population and housing census ever to be conducted in the country. The first population and housing census was conducted in May 1984. The Second Population and Housing Census of Ethiopia was conducted beginning 11 October, 1994 and was completed in most areas within the following ten days. Eleventh of October, 1994 was used as the census day. The questionnaires used for the census were prepared in Amharic. English translations of the questionnaires used in the census are presented at the end of the report. The types of questionnaires used were:

i) Short Questionnaire (Appendix I)
ii) Long Urban Questionnaire (Appendix II)
iii) Long Rural Questionnaire (Appendix III)

The content of the short questionnaire was similar in urban and rural areas. The questionnaires were filled-in by enumerators who went from one household to the next. All members of the household were recorded on the same questionnaire. The short and the long questionnaires differed on the number of variables collected. The short questionnaire collected basic data on population such as population sizes, sex, age, language, ethnic group, religion, and marital status. In addition to these, the long questionnaire included data on disability, education, economic activity, migration, fertility, mortality, and housing stocks and conditions.

The type of questionnaire administered to each household was determined by using a systematic sampling selection procedure. During the three days before the census day all households, and housing units were listed in a separate form designed for the purpose. This list was used to identify the type of questionnaire that was to be administered to the households. One out of five households was selected to be interviewed using the long questionnaire, while the other four were interviewed using the short questionnaire. Residents of hotels, hostels and other collective quarters were always interviewed using the long

questionnaire. Short questionnaire was also administered on the homeless persons.

Some of the information collected for the region which refers to population sizes, sex and age composition, language, ethnic, religious and marital distributions was collected from all persons covered in the census. However, some other information was collected from only a sample of the population. This refers to disability, education, economic activity, migration, fertility, mortality, and housing stocks and conditions. Even though the above information was collected from a sample of the population, statistical weights were applied to the information collected in order to let them represent the entire population. This means that the numbers presented in the tables that refer to disability, education, economic activity,... etc. represent the entire population of Oromiya Region and not only the sample population.

The fact that the information was collected from a sample of households and not from the entire households does not make the information less reliable. In fact this process increases the quality of the information collected by reducing the work load that would have been faced if all households were covered using the long questionnaires. The reduction of the work load improves the quality of the data because it is expected to facilitate a closer supervision during field work, enable better data coding and editing, and enable the timely processing of the data collected. The census was conducted by enumerators who went from house to house filling in the questionnaires designed for the purpose. Homeless persons were enumerated in the place where they were spending the night.

This report contains two chapters. The first chapter serves as an introduction to the report. Chapter V presents the migration, fertility and mortality conditions. Annex I presents six summary tables about the population size of the region. Annex Table 1 presents the population size of the region obtained from the census plus estimates for areas not covered in the census classified into zones and weredas. Annex Table 2 presents the estimated population size of the areas not covered in the census

The tables presented here were selected from a long list of tables that have already been produced for Oromiya Region. The forthcoming analytical report for the 1994 Population and Housing Census data of Oromiya Region will also present some of these tables. The analytical report will concentrate more on providing indepth analysis rather than providing detailed tabulations. Analysis of the results of the census data are expected to continue even after the production of the analytical report.

Mieso and Darolebu weredas of Mirab Harerge Zone. The kebeles that were not covered in the census were: a kebele in Ejersa Goro Town (i.e the whole town) of Jarso Wereda; a kebele in Mulu Town (i.e the whole town) of Mieso Wereda; parts of kebele 01 and parts of kebele 02 in Moyale Town of Moyale Wereda. For details concerning the farmers' associations not covered in the census, reference may be made to Table 7.2 Volume I: Part VI.

The statistical tables presented in this report all refer to the areas that were covered during the census only, except in a few cases where it is explicitly stated that estimates for the areas not covered in the census are included. In this report, the population size of the areas covered in the census plus those that were not covered in the census is presented by zones and weredas in Annex Table 1. The estimated population size of the areas not covered in the census by zones and weredas are presented in Annex Table 2, and the estimated population sizes of towns not covered in the census are presented in Annex Table 3. The population size estimates for the farmers' associations not covered in the census are presented in Table 7.2 in Volume I: Part V. The population projection for the region is prepared using the total of the census covered plus the estimated population sizes. All the other tables refer to the census covered population only. In these tables, the information for weredas that were only partly covered during the census refer to the census covered population only. Jarso wereda will not appear in any of these tables because it was not covered during the census.

Localities were identified as towns or rural areas during the census cartographic work. Towns were defined as localities in which Urban Kebele Administration (previously known as Urban Dwellers Association) has been established. Localities that had 1000 or more persons whose inhabitants were primarily engaged in non agricultural activities were identified as towns irrespective of whether Urban Kebele Administration has been established or not. CHAPTER V

MIGRATION, FERTILITY, AND MORTALITY

The previous chapters in this volume dealt on the description of the characteristics of the population. Part III deals with the changes (dynamics) that are occurring in the population. These are migration, fertility and mortality. The first section deals with migration and it will be followed by fertility and mortality.

A. MIGRATION

Information on migration of a population is of direct interest to planning and implementing agencies as well as academic institutions, because migration has a direct effect on the geographic distribution of the population. Moreover, migration has an interaction with other demographic forces as well as other aspects of social and economic changes. In recognition of the importance of this variable as one of the components of population change, data on migration was collected in the 1994 Population and Housing Census of Ethiopia.

In the 1994 census, two migration related questions were employed. These were: " Length of continuous residence" and "Place of previous residence". The former question provides information on the timing of migration while the later provides information on area of origin.

The "length of residence" of each person refers to the number of years the person has been continuously residing in a town or rural part of the wereda of enumeration. The length of stay was recorded in completed years.

In the census, information on length of residence was collected differently in the urban and rural parts of the country. The question asked in the urban areas referred to the number of years the person has been continuously residing in the

town. In the rural areas, the question referred to the number of years the person has been continuously residing in the rural parts of the wereda of enumeration.

Thus, in the urban areas a person who was born in a given town and has been continuously residing there is considered as a non-migrant. However, if the person was born in another town or any rural part of the country, then, he/she is considered as a migrant. Similarly, a person who was born in the town of enumeration but at one time or another resided in a different town or a rural area and has returned to the town of enumeration is considered as a migrant(return migrant).

In the rural areas, a person who was born in a rural area of wereda of enumeration and has been continuously residing there is considered as a non-migrant. However, if the person was born in a rural part of another wereda or any town , then, he/she is considered as a migrant. Similarly, a person who was born in the rural part of the wereda of enumeration but at one time or another resided in a rural part of a different wereda or any town and has returned to the rural part of the wereda of enumeration, is considered as a migrant(return migrant).

The "area of previous residence" refers to the area where the migrant has been residing before he/she migrated to the area of enumeration. In the census, the " area of previous residence" of migrants was recorded as "rural" or "urban" if the person has migrated from rural or urban areas, respectively. This enables the classification of all migrants as migrants from rural or urban areas.

This section presents the main findings based on the two migration related questions discussed above for Oromiya region. Tables 5.1A - 5.1C present population by age group, sex, migration status, area of previous residence of migrants and area of enumeration . Tables 5.2A - 5.2B present population by sex, migration status, area of previous residence of migrants and area of enumeration (zones, urban, rural, and towns). Tables 5.3A - 5.3C present the length of residence of the in-migrants

(classified by age and sex of in-migrants) in area of enumeration. Finally, Tables 5.4A - 5.4B present in-migrants by sex, length of residence in the area of enumeration (zones, urban, rural and town). The length of residence classifications used were less than one year, one year, two years, three years, four years, 5-6 years, 7-9 years and 10 years and above.

B. FERTILITY

This section presents the fertility level of the population of Oromiya Region. In the 1994 Population and Housing Census Questionnaire information was collected on both current and retrospective fertility from every woman aged 10 years and over.

Data on current fertility was obtained by asking, "Did you have a live birth during the last twelve months prior to the census day?." Information on retrospective fertility was obtained by asking about the total number of children ever born alive, number of children living at home, number of children living elsewhere, and number who had died up to the census day.

Generally, data on current and retrospective fertility collected in censuses of developing countries are not usually free from error. Data on total number of children ever born may also be distorted due to recall-lapse and socio-cultural factors, above all, because of the extended family system in the country, the women are likely to include relatives with their own. Again, the various social practices associated with birth of small babies, especially those births that end in early death are likely to have been omitted from reporting. Another source of error in the reported number of children could be the inclusion of still births. These probable errors should be borne in mind while interpreting reported fertility measures presented in this section.

Reported Current Fertility

Based on the question asked about number of births given in the year preceding the census day, reported fertility measures were computed and presented in Table 5.5A and 5.5B. The measures include Crude Birth Rate (CBR), General Fertility Rate (GFR) and Total Fertility Rate (TFR).

The Crude Birth Rate refers to the total number of births occurring in a given year per 1000 mid-year population. The General Fertility Rate is defined as the number of births

occurring in a given year per 1000 women in the reproductive ages (i.e. women aged 15-49).

The other fertility parameter which takes into account the age structure of the population is what is known as Total Fertility Rate (TFR). Total Fertility Rate refers to the number of children a woman is likely to reproduce at the end of her reproductive period given the current age-schedule of fertility rate. Reported total fertility rate for Oromiya Region is about 4.9 children per woman. The corresponding figure in urban and rural areas of Oromiya Region were 3.4 and 5.1 respectively.

The above mentioned fertility measures indicate only the level of fertility. Tables 5.6 and 5.7 give the number of women and births by age and the corresponding age specific fertility rate-ASFR (the ratio of births to women in each age group). The age specific fertility rates reveal that about 67.1 percent of the total births given in the year preceding the census day are born by women in the age group 20-34. The women in the early twenties (20-24) and thirties (30-34) and late twenties (25-29) are the most fertile. The observed pattern of fertility by age group holds true for both urban and rural areas.

The analysis on current fertility excludes women who did not state number of births they had during the 12 months before the census day. Hence the number of women in the various age groups in this table may not be consistent with other figures in the report.

Cumulative Fertility

The other fertility index of interest is the mean number of children ever born presented in Table 5.8 for the total, rural and urban areas of the region. Summary measure on mean number of children ever born for each zone and each urban center that has 10,000 and above persons is also presented in Tables 5.10 and 5.11. Completed fertility is imputed from data on number of children ever born by women aged 45-49 years. Comparison of the mean number of children ever born at age group 45-49 and TFR,

revealed a difference of 1.3 children for total, 2.4 children for urban, and 1.2 children for rural areas. This pronounced difference in the urban areas (about 2 and a half children) may indicate that fertility is declining recently in the urban areas of the region.

The fertility measures reported in this section are all reported levels. No attempt has been made to make adjustments to the levels of fertility. Detailed analysis of the level of fertility will be made in the analytical report that will be forthcoming soon.

C. MORTALITY

For the analysis of mortality only one type of information was collected in the 1994 Population and Housing Census. The question was addressed to women in their reproductive ages and referred to the total number of children ever born and the number surviving. To get the data, all women aged 10 years and over were asked the total number of sons and daughters they ever gave birth to, the total number living at home, and the total number living elsewhere and the total number that died. This information was then utilized to provide estimates of infant and under-five mortality and expectation of life at birth. These mortality indicators are defined as follows:

Infant mortality ($1q_o$): the probability of dying between birth and age one per 1000 live births in a given year.

Under-five mortality ($5q_o$): the probability of dying between birth and age five per 1000 live births.

Expectation of life at birth (e°_o): refers to the average number of years a new born baby is expected to live if he/she is exposed throughout its life to the prevailing pattern of age specific death rates.

In order to estimate these mortality indices the Trussell Variant of the Brass Indirect Technique (UN, 1983) was employed and the West Family of the Coale and Demeny Model Life Tables were selected as the standard pattern of mortality. But the reliability of indirect estimates based on children ever born and surviving data highly depend on the quality of reporting of children ever born, children dead and age of women. Thus, any bias in the reporting of these data might lead to over or under estimation of mortality. In the census the proportion of women in the reproductive age (15-49 years) who did not report their parity and number of children dead were not very high, being 1.0 percent for the Oromiya Region. For this reason, these women

were totally discarded from the analysis. Furthermore, it should be noted that since the estimates based on reports of women aged 20-34 have been proven to be relatively accurate than the estimates of younger and older women, infant and child mortality rates provided were an average of the three age groups, namely 20-24, 25-29 and 30-34.

Infant and under-five mortality estimates along with the corresponding life expectancies at birth for Oromiya Region and its rural and urban sub-divisions are presented in Table 5.9A. Also similar estimates are presented in Table 5.9B for urban centers that have population sizes of 10,000 and above persons. The data indicate an infant mortality rate of 118 per thousand live births and under five mortality rate of 173 for the Region. The expectation of life at birth for Oromiya Region was found to be 50.4 years for both sexes, 49.2 years for males and 51.7 years for females. The data in Table 5.10 and Table 5.11 provide the distribution of number of children ever born and number surviving, by age group of women as reported during the census. These tables were the basis on which the estimated levels of mortality were derived. More detailed analysis of the levels of mortality will be presented in the indepth Census Analytical Report of Oromiya Region that will be forthcoming.
