Acknowledgement

The 2013 Employment and Unemployment Survey Project of Addis Ababa (ESPAA) was implemented under the agreement made between Addis Ababa Bureau of Labour and Social Affairs /BoLSA/ and Central Statistical Agency /CSA/ in March 2013.

As per the agreement, this statistical report contains the detailed statistical tables of sub cities of Addis Ababa with brief descriptions. The total enumeration areas surveyed in the city were 250 which covered 7,437 households. Out of the total enumeration areas, 99.2 % was successfully covered.

This survey was conducted from 24 May/2013 - 12 June 2013 as a part of the 2013 National Labour Force Survey. The funding for the survey was provided by BoLSA. The staff members assigned from BoLSA has also given their unreserved support in facilitating the survey operation.

The survey would have not been successfully completed without the kind cooperation of the respondents. The dedicated professional CSA staff members and data processing personnel at head office and the excellent contributions of the staff members of the statistical branch office of Addis Ababa as well as field enumerators and supervisors who have discharged their responsibilities in collecting the data under very difficult situations are deeply appreciated.

The CSA also acknowledges the following persons who contributed in various ways to the successful completion of the project of ESPAA.

Ms. Samia Zekaria, General Director, CSA
Mr. Biratu Yigezu, Dupty General Director, CSA
Mr. Epherem Gizaw, General Director, Addis Ababa BoLSA
Mr. Kassa Syoum, Dupty Director, Addis Ababa BoLSA
Mr. Alemayehu Teferi, Household Surveys and Price Statistics Directorate Director
Mr. Teshome Adno, Senior Statistician, CSA
Mr. Asalefw Abera, Senior Statistician, CSA
Mr. Abbay Getachew, Senior Statistician, CSA
Mr. Getachew Mohammed, Senior Statistician, CSA
Mr. Sharew Ararsa, Senior Statistician, CSA
Mr. Salah Yousuf, Senior Methodology Expert, CSA.
Mr. Esayas Muleta, Senior Methodology Expert, CSA.
Mr. Abas Shelemew, Senior Programmer, CSA
Mr. Alamerew Belay, Team Leader, Addis Ababa BoLSA
Mr. Muluken Tefera, Senior Expert, Addis Ababa BoLSA

CHAPTER I

BACKGROUND TO THE SURVEY

1.1 Introduction

Addis Ababa is the capital city of Ethiopia where all kinds of economic and social activities are concentrated. Since Addis Ababa is experiencing fast growing urbanization, proper management and efficient utilization of its work force is essential. In this respect, the capacity of the economic activity of the city absorbing the potential labour force needs to be monitored regularly, and appropriate measures on employment creation should consequently be adopted. Thus, the level and quality of employment situation is one of the indicators in evaluating the current performance of the economic activity. The statistical analysis of the work force in Addis Ababa and other major urban centers of the country is essential both in tackling the urban poverty and foreseeing future challenges of urbanization.

Employment survey is among the important sources of data to assess the participation of the population in the economic and social development process. It is useful to indicate the extent of available and unutilized human resources that must be absorbed by the economy to ensure productive employment and economic well being of the population. Such surveys provide data on the main characteristics of the work force engaged or available to be engaged at different economic activities during the given reference period and the distribution in the various sectors of the economy. The data also serve as an input to monitor and evaluate the five years Growth and Transformation Plan /GTP/ of the Country.

The Central Statistical Agency (CSA) has been providing employment and related data for the city for the last three decades. These include the 1976 Addis Ababa Manpower and Housing Sample Survey; the 1978 Survey on Population and Housing Characteristics of Seventeen Major Towns; the 1984, 1994 and 2007 Population and Housing Censuses. Considering the development process of the country and dynamic nature of the sectors, the CSA has also been launched the National Labour Force Survey program (NLFS) every five years, while Urban Employment

Unemployment Survey /UEUS/ every year since 2003. The 1999 and 2005 National Labour Force Surveys provide a comprehensive employment data regarding the city.

However, there is dearth of statistical data for each sub city. Therefore, for the purpose of fulfilling the demands of data users, the CSA in collaboration with Addis Ababa Bureau of Labour and Social Affairs /BoLSA/ has collected a range of employment and unemployment data at sub city level. For the execution of Employment Survey Project of Addis Ababa/ESPAA/, BoLSA allocated a total of budget of Birr 2,953,656. The survey was conducted as part of the 2013 National Labour Force Survey. The detailed statistical tables with brief descriptions for Addis Ababa and each sub city are presented in the subsequent chapters.

1.2 – Objectives of the Survey

The general objective of the Employment Survey Project in Addis Ababa is designed to provide statistical data on the size, characteristics and distribution of paid employment in the various sectors of the economy. The data will be useful for policy makers, planners, investors, researchers and other institutions who are engaged in the design, implementation, monitoring and evaluation of human resource development programs.

The specific objectives of the survey include: -

- Identify the size, distribution and characteristics of paid employees with respect to basic socio-demographic characteristics disaggregated by age sex, educational level and training status of paid employment;
- Distribution of paid employees by major occupation and industrial divisions;
- Provide population estimates for each sub city;
- Distribution of paid employees by amount of earnings and terms of employment as well as service year;
- Produce data on important characteristics on unemployment;
- Provide data on the economic participation of disabled population;

- Identify the reason for job mobility of paid employees between different sectors and the extent of labour turnover rate;
- Assess employment aspects of micro and small enterprises;
- Assess the reason for job dissatisfaction of paid employees;
- Generate gender disaggregated data to show the participation and situation women's employment in the various sector of the economy;
- To enhance the capacity of BoLSA for understanding other surveys.

1.3 Development of the Questionnaire

The survey is mainly aimed at providing information on the size and distribution of paid employees and related economic characteristics of the population in the city aged 14 years and above during the last seven days prior to the survey date. It has also covered detailed socio-demographic background variables such as age, sex, migration, disability and literacy status, educational level, training and marital status. The survey has used a structured questionnaire to produce the required data.

According to the interest of BoLSA, some questions like the characteristics of paid employees by different related variables such as major division of economic activities, amount of earnings, job mobility, job satisfaction, terms of employment and service year ...e.t.c., were included in the main questionnaire. Before taking its final shape, the draft questionnaire was also commented by Addis Ababa BoLSA experts and CSA senior staff representing different directorates as well as top management. The content, layout and presentation of the questionnaire were amended based on the comments provided by the corresponding professionals.

The questionnaire was organized into six sections;

- Section - 1:** Area identification of the selected household: this section deals With area identification of the respondents such as region, zone, wereda, etc.
- Section - 2:** Socio- demographic characteristics of households: it consists of the general socio-demographic characteristics of the population

such as age, sex, educational Attainment, status and type of migration, disability, literacy status, educational Attainment, types of training and marital status.

Section – 3: Economic activities during the last seven days: this section deals with a range of questions that help to see the status and characteristics of employed persons in a current status approach such as hours of work in productive activities, occupation, industry, status in employment, earnings from employment, job mobility, service year for paid employees employment in the formal and informal sector and time related underemployment.

Section – 4: Unemployment and characteristics of unemployed persons: this section focuses on the size, rate and characteristics of the unemployed population.

Section – 5: Economic activities during the last twelve months: this section consists of the usual economic activity status referring to the long reference period i.e. engagement in productive activities during most of the last twelve months, reason for not being active, status in employment, main occupation and industry with two digit codes.

Section – 6: Economic activities of children aged 5-17 years: this section comprises information on the participation of children aged 5-17 years in the economic activities, whether attending education, reason for not attending education, whether they were working during the last seven days, reason for working, for whom they are working, types of injury at work place, whether using protective wear while working and frequency of working periods, and orphan hood status.

The questionnaire used in the field for data collection was prepared in Amharic language. Most questions have pre-coded answers. A copy of the questionnaire translated in to English language is attached as Annex I of this report.

1.4. Limitations of the survey

Lack of income data for self-employment is a limitation of this survey. It is believed that it is difficult to collect data on income from self employment in a situation where most people do not want to give information about their actual income or earnings. Furthermore, specifically the currently available techniques developed for measuring income from self employment are not refined and yet ambiguous. However, income data that would supplement the available information could be obtained from other sources like the Household Income, Consumption and Expenditure Survey.

1.5 Concepts and Definitions of Key Variables

Urban Center: - is generally defined as a locality with 2000 or more inhabitants. In the 1994 Population and Housing Census Cartographic work, however, for practical purposes an urban center includes the following regardless of the number of inhabitants. All administrative capitals (Regional capitals, Zonal capitals and Wereda capitals), Localities with Urban Dweller's Association (UDAs) not included in (i), All localities which are not included either in (i) or (ii) above having a population of 1000 or more persons, and whose inhabitants are primarily engaged in non-agricultural activities.

Enumeration Area (EA): is a unit of land delineated for the purpose of enumerating population and housing units without omission and duplication. An EA in rural areas usually consists of 150-200 households, and on the other hand an EA in urban areas constitutes 150-200 housing units.

Household: Consists of a person or group of persons, irrespective of whether related or not, who normally live together in the same housing units or group of housing units and have common cooking and eating arrangements.

Head of household: is a person who economically supports or manages the household or for some reason of age or respect is considered as head by the other members of the household. It could be a male or a female.

Usual member of a household: a person is considered as usual members of a household if he or she is: a person who continuously, that is, at least for six months live and have a common cooking and eating arrangements with the household; or a person who is absent from the household at the time of the survey but his absence has not elapsed the six months criterion. Housemaids, guards, baby sitters, etc...with no other dwelling and who were staying with the household at the time of the survey are considered as usual member of a household. Definitions of other key concepts and core variables used in this survey are provided in respective chapters.

1.6 Training of Field Staff

The training program of enumerators, supervisors, statistician and other field staffs were conducted in two stages. The first stage training was conducted from April 22/2013 – May 2/2013 at two training centers in Ambo and Adama towns for ten days. The first stage trainees were selected from CSA head and branch offices and Addis Ababa Bureau of Labour and Social Statistics /BoLSA/. The training was given by head office professionals and sub-professionals with long time experiences. The training was guided by an enumerator and supervisor manuals, occupation and industry code book, which consist of detailed explanation of concepts and instructions on how to fill each entry in the questionnaire.

The second stage of training was organized for all field staff and was conducted at 25 branch statistical offices. Those who were trained at the head office in turn gave similar training for enumerators and field supervisors from May 9/2013 – May 21/2013 for about twelve days. The training consisted of classroom discussions on concepts and definitions, techniques of filling the questionnaire as well as mock-interview and one-day field practice followed by general discussion. The objectives of mock interview and field practice were twofold. First, it enabled to assess how well the theoretical class discussions were understood by all participants. The second objective was to examine the difficulty which would likely be encountered during actual fieldwork. The discussions were intended to exchange experiences among participants and pinpoint the areas of the survey questions that need more care and attention.

All the branch statistical offices of the CSA participated in the survey undertaken, that is, in organizing the second stage of training, in deploying the field staff to their respective sites of assignment, and retrieving completed questionnaires and submitting them to the head office for data processing. They were also responsible in administering the financial and logistic aspect of the survey as well as field supervision within the areas of their assignment.

1.7 Organization of the Fieldwork

In order to carry out this survey with the desired level of quality, there was a need to organize a large staff that performs the various survey activities. The 25 Branch Statistical Offices of the Agency carried out the data collection operation. These offices have permanent and contract enumerators stationed in the selected enumeration areas. The data collection operation of the survey involved a total of about 108 enumerators and about 57 field supervisors, 2 statistician and 7 coordinators from Addis Ababa branch office involved with an average supervisor-enumerator ratio of 1: 3.

Data collection from the field took place from 24 May, 2013 - June 12, 2013. However, due to different reasons, in some of the enumeration areas, the field data collection was extended by two weeks. The data collection was also carried out in phases, that is, after completing the data collection in some selected enumeration area, enumerators were shifted to another sample sites to carry out the same exercise. Most of the data collection operations were completed within two rounds and in some sites finished with three rounds.

The interviews were conducted by going from house-to-house using a structured questionnaire and relevant codebook. The data was collected from each sampled households and the respondent from whom the information collected was the head of the household or other responsible household member. Most of the enumerators were assigned to one sampled enumeration areas in which they could easily converse with the respondent's dialect. Interpreters were made available in cases where there is difficult to converse.

Field supervision was undertaken side by side with the data collection. During the survey data collection operation, close and regular supervision was undertaken at various levels. Immediately after the commencement of the data collection exercise, the supervisors had made spot checking, re-interviewing and a thorough scrutiny of filled-in questionnaires were applied to ensure that the data collection activities being carried out according to the given instruction. In addition to this, the branch statistical office heads and statisticians made supervision of the data collection operation. Moreover, senior staff members from the CSA head office made field supervision activities for ten days in different directions.

1.8 Organization of the Report

This report contains six chapters. The first chapter covers background to the survey, where the objectives, the contents of the survey questionnaire, concepts and definitions of key variables, limitations of the survey and organization of the report were discussed. Chapter II deals with the survey methodology, where scope and coverage, sample size and response rate, training of field staff, organization of fieldwork, and data processing were dealt. The results of the survey are presented in the subsequent four chapters, that is, chapters III to VI. Chapter III deals with the size and socio-demographic characteristics of the population such as the distribution of population by age, sex, disability, migration, literacy status and educational levels. Chapter IV presents data on the economic participation of the population aged ten years and over. Chapter V explores the characteristics of the employed population; finally Chapter VI focuses on the detailed characteristics of the unemployed population. Statistical tables corresponding to each of the summary chapters are presented in their respective section.

1.9 Data Processing

During the fieldwork, the field supervisors, statisticians and the heads of branch statistical offices have checked the filled-in questionnaires and carried out some editing. However, the major editing and coding operation was carried out at the head office. All urban questionnaires were subjected to complete manual editing, while

most of rural questionnaires were partially edited. All the edited questionnaires were again fully verified and checked for consistency before they were submitted to the data entry. This system of data processing was followed on the assumption that, there is less complication of activities in rural areas than urban centers.

After the data was entered, it was again verified using the computer edit specification prepared earlier for this purpose, the entered data were checked for consistencies and then computer editing or data cleaning was made by referring back to the filled-in questionnaire. This is an important part of data processing operation in attaining the required level of data quality. Consistency checks and re-checks were also made based on tabulation results. Computer programs used in data entry, machine editing and tabulation were prepared using the CSPro data entry and analysis package.

CHAPTER II

SURVEY METHODOLOGY AND DATA PROCESSING

2.1 Coverage

The 2013 Employment Survey of Addis Ababa covered all sub cities of Addis Ababa. It was initially planned to cover 25 Enumeration Areas (EAs) in each sub city totally 250 EAs and 7500 households. Out of the initially planned, 249 EAs and 7437 households were actually covered by the survey. The response rate was highly satisfactory, 99.6% and 99.2% of the planned enumeration areas and households were successfully covered by the survey, respectively.

2.2 Sampling Frame

The list of Sampling Frame obtained from the 2007 Population and Housing Census was used to select EAs. A fresh list of households from each EA was prepared at the beginning of the survey period. The list was then used as a frame for selecting sample households of each EA.

2.3 Sample Design

Unlike the previous Labour Force surveys, Employment Survey of Addis Ababa was designed to provide estimates not only for total Addis Ababa city Administration but also for each sub cities in Addis Ababa. Therefore, for the purpose of appropriate sample size determination and allocation across sub cities ten survey domains were formed. Each sub city was considered to be a survey domain (Reporting Level) for which major findings of the survey are reported.

A stratified two-stage cluster sample design was used to select samples in which the primary sampling units (PSUs) were EAs. Households per sample EA were selected as a second Stage Sampling Unit (SSSU) and the survey questionnaire finally administered to all members of sample households.

2.4 Sample Size and Selection Scheme

In order to achieve the survey objective, the appropriate sample size of 250 EAs and 7500 households were determined and equally allocated to each sub cities. Sample EAs of each sub city was then selected using Probability Proportional to Size (PPS) systematic sampling technique; size being number of household obtained from the 2007 Population and Housing Census. From the fresh list of households prepared at the beginning of the survey 30 households per EA were systematically selected and surveyed. For the distribution of planned and covered number of samples from each domain/sub city (see Summary Table 2.1 below).

Summary Table 2.1 Distribution of Planed and Covered EAS and Households: Addis Ababa City Administration

Addis Ababa City Administration	Reporting Domain/ Sub Cities	EAs			Households		
		Planned	Covered	Response Rate	Planned	Covered	Response Rate
Addis Ababa	Akaki Kaliti	25	25	100.0	750	749	99.9

Including Addis Ababa City Administration, totally 11 reporting levels were formed. Estimation procedures and standard errors & coefficients of variations for the estimates of selected variables are also presented in Annex II & Annex III, respectively.

CHAPTER III

SIZE AND SOCIO - DEMOGRAPHIC CHARACTERISTICS OF THE POPULATION

3. Introduction

The socio-demographic characteristics of the population presented in this chapter include age-sex distribution, migration, disability, marital status, educational attainment and training status. Data were collected from each member of the selected household member using survey questionnaire. A minimum age limit was set for data on marital status, educational attainment and training status of the population. Accordingly, marital and training status was asked for persons aged ten years and above while education was asked for persons aged five years and above.

3.1 Population Size and Distribution

Population size is one of the most important variables in human development planning. Besides, the age-sex structure of the population is another crucial that influences the labour force participation of the population. It is also vital for making component and sectoral projection. Age and sex are not only important by themselves but are also useful for an in-depth analysis of other socio - economic and demographic characteristics of the population.

Table 3.1 presents the estimated population of Sub cities of Addis Ababa City Administration classified by age group and sex, while Table 3.2 and 3.3 shows the distribution of the population of Sub Cities of Addis Ababa by number of households, average household size and sex of head of households and average household size. The survey result shows that the total population of Addis Ababa City Administration residing in conventional households in June 2013 estimated to be 3156057 of which 1464887 (46.4 percent) were males and 1691170 (53.6 percent) were females excluding the visitors, persons residing in collective quarters (hotel/hostels, boarding

schools, prisons) as well as homeless persons. The distribution of population by place of residence indicates that Addis Ababa City Administration constitutes 3.9 percent of the total population.

3.2 Population Characteristics

Duration of continuous residence is one of the questions incorporated in the questionnaire so as to identify migrants and non-migrants. It is also important to determine the timing of migration from a place to another place. The data on duration of continuous residence was collected in urban and rural areas from each member of the household in slightly different manner. The question was asked in urban areas in referring the number of years the person has been continuously residing in the town, while in the rural areas referring to the number of years the person has been continuously residing in the rural part of the Woreda.

A person who was born in a town and has been continuously residing there is considered as a non-migrant. However, a person who was born in another town or any rural part of the country is considered as a migrant. Also, a person who was born in the survey town but at one time or another resided in a different town or rural area and returned to the town is considered as a migrant (return migrant).

Similarly, a person who was born in a rural area of the Woreda of enumeration and has been continuously residing there is considered as a non-migrant. However, a person who was born in a rural part of another Woreda (other than the Woreda of enumeration) or any town is considered as a migrant. Also, a person who was born in the rural part of the Woreda but at one time or another resided in a rural part of a different Woreda or any town and returned to the rural part of the Woreda is considered as a migrant (return migrant).

For someone who keeps on coming to and going away from his / her area of enumeration, a six – months of time period was used to define his / her migration status.

Thus, if an individual is absent from his / her usual place of residence for more than six months and not expected to return to his/her place of residence then he / she is considered as not continuously residing in that particular area. In the survey, a person is said to be a usual resident of an area if he/she has been residing in the area continuously for at least six months before the survey date or intends to reside in the area for six months or longer.

Table 3.4 and 3.5 indicates the distribution of population of Sub Cities of Addis Ababa by migration status, duration of continuous residence, age group and sex. Matrix of migrant population of Addis Ababa classified by current and previous Urban and rural residence, age group and sex is presented in Table 3.6a - 3.6c.

CHAPTER IV

ECONOMIC ACTIVITY STATUS

4.1 Introduction

Statistical data on economic activity status of a population is essential for planning and formulating policies for better utilization of human resources of a country. The economic activity status indicates the size and distribution of the work force of economically active and not active population during a given reference period at a specified area.

In this regard, a wide range of information was collected on economic activity status of all persons aged five years and above in the 2013 Employment Survey of Addis Ababa. For the purpose of gathering information about the economic activities of children, the lower age limit was fixed at five years and hence data were collected from persons aged five years and above. However, for measuring the economic activity status of the population those persons aged 10 years and above were included in the analysis.

The survey in this section administered detailed labour related questions to measure the economic activity status of a population in the city. These includes:-

- whether persons were engaged in economic / productive activities in the last seven days prior to the survey date or reasons for not being engaged;
- whether persons were looking for work or will be available for work in the coming one month or reason for not being available during the reference period;
- whether persons were engaged in economic / productive activities during most of the last six months or reasons for not being engaged.

Every person aged five years and above in the sampled household was asked if he/she was engaged in any economic activities during the last seven days, and the

last twelve months prior to the survey date. Based on the response obtained from respondents, the economic activity status of the population was determined by using the standard definitions of economic and non-economic activities.

The survey followed the ILO international standard definitions of economic and non-economic activities. The concept of economic activity as adopted by the 13th International Conference on Labour Statistics (ICLS, 1982) is defined as the production of goods and/or services that falls within the United Nations System of National Accounts (SNA) production boundary (ILO, 1990). The term economic / productive activity is defined as work, which involves the production of goods and /or services for sale or exchange. In addition, production of goods and services for own consumption or own uses are also considered as economic activities. These include production of primary products (agriculture, hunting, fishing, forestry and logging, mining and quarrying), for own consumption; processing of primary products by the producers themselves; production of other commodities where part of it is sold on the market; and own account construction and fixed asset formation (expected life use of one year or more). Such economic activities could be performed for an individual, family or private enterprise, government establishment or social organization. The remuneration may be on daily, weekly, monthly, yearly or contract basis. The practical activities of apprentices are also considered as economic activities. On the other hand, unpaid household chores such as preparing food, cleaning the house, taking care of children are not considered as economic activities. Similarly, unpaid community and volunteer services are classified as non-economic activities.

Based on the ILO definitions of economic and non-economic activities, data on economic activity status of persons aged 10 years and above was presented in this report. Persons who were engaged in productive work /employed/ or available to be engaged /unemployed/ during the reference period are considered as economically active persons. While those persons who were neither engaged nor available to be engaged in the production of economic goods and services during the reference period are considered as economically not active population.

4.1.1 Data Collection Approaches

In the 2013 Employment Survey of Addis Ababa, two approaches were used to collect data about the economic activity status of the population. These are current and usual activity status approaches. The main difference between these two approaches is the length of the reference period. In the usual activity status approach data was collected about the economic activity of the population during the long time interval i.e. the last twelve months. On the other hand, the current activity status approach data was collected with reference to a shorter reference period of the last seven days prior to the date of interview. In this survey, though data on economic activity status of the population was collected using the two approaches, the result presented in this report refers to only the current activity status approaches.

This chapter presents the economic activity status, size and distribution of economically active and not active population, activity rate, and reasons for being not active of the population aged 10 years and above using only the current status approach. In addition, it contains the characteristics of employed population, and unemployment in Addis Ababa.

4.1.2 Current Activity Status

As mentioned above, current activity status approach measures the economic activity status of a person in a short reference period, that is, the seven days prior to the date of the interview. In this approach a series of inquiries were administered to determine the economic activity status of the population during the reference week such as engagement in economic activity, attachment to jobs, seeking and availability to work, reason for not seeking or available to work, etc. These questions were presented to those persons aged five years and above. But the responses of persons aged 10 years and above were used to classify the population into three mutually exclusive categories: employed, unemployed, and not in the labour force (economically not active). The employed and the unemployed population together

constitute the labour force or the currently economically active population. The third category, those who were not in the labour force are called currently economically not active population.

As part of the economically active population, employed population consists of persons aged 10 years and above who engaged in a productive activity or work at least for one hour during the seven days prior to the date of the interview. In addition, persons who had regular jobs, or business, or holdings to return to but who were temporarily absent from work (not at work or worked less than one hours) for various reasons such as illness or injury, holiday or vacation, strike or lockout, and seasonality of work, annual leave, temporary closure of establishment were also considered as employed. For a person to be considered as absent from work, he/she must have formal attachment to the job.

The currently unemployed population also comprises those persons without work but looking for work or available and ready to work if any job is found during the reference period of the coming one month. The reference period of the coming one month refers to the survey week plus the next three weeks. If a person who is looking for work but engaged in productive activity during the reference week is recorded as employed but not as unemployed.

4.1.3 Economically Active and Not active Population and Activity Rate

Based on the above definition of economic activity status, the number of economically active population including employed and unemployed persons, population not active and activity rates of the population aged ten years and above at City and Sub-City level is presented by sex and age group in Table 4.1 using the current status approach. Besides, the distribution of economically active population aged ten years and above is also presented in Table 4.2.

The extent of the economic participation of the population is measured using economic activity rates. Economic activity rate or economic participation rate is computed as the percentage of the economically active population over the total of active plus not active population aged ten years and above. The city's estimate shows that 62.8 percent of the population aged ten years and above were economically active (Table 4.1). With respect to sex, the activity rate of male is 71.0 percent and the corresponding female activity rate is 55.9 percent. The age distributions of activity rate illustrate that it is low at younger and older age groups. The table also shows a relatively stable for middle ages between 25-49 years, and reaches its peak in age group 35-39 (Table 4.1).

As far as the size economically active population of the city is concerned, the total number of active population was 1,695,065. Out of this size, the number of employed persons was 1,285,598 while the remaining 409, 467 was found to be unemployed persons. In terms of sex, the size of employed males was higher than their female counterparts (Table 4.2). Table 4.3 presents the number of economically active population by migration status. Thus, from the total size of active population of the City, the number of all migrants was 848,457 and the remaining number was non-migrants. Concerning the marital status of the city, the share of never married persons was higher followed by married persons. Those persons who lived together (cohabitants) registered the lowest number (Table 4. 4).

The size of economically active and not active population has its own implication on the development of the local as well as the national economy of a region. The high activity rate of a population implies the prevalence of huge potential of the human resource or human labour that foster sustainable economic development. On the other hand, the low economic activity rate also implies the lack of adequate and trained human labour or the existence of large number of economically non-productive population which has no contribution for development at the time. Hence, the economic activity rate of the population of the Addis Ababa City Administration can be viewed from these perspectives.

The distribution of economically not active population of the Addis Ababa City by age group, sex and reason for not being economically active (for those who were neither engaged nor available and/ or seeking work) during the last seven days are presented in Table 4.5. The reasons for not looking for or available to work include; home maker, pregnancy, student, injury/ disability, illness, too young, old age, pensioned, remittance, and other reasons. The result in Table 4.5 shows that the lion shares of the population not active were students (61.7 percent) for the Addis Ababa City. The remaining was the other groups of not active population.

4.2. CHARACTERISTICS OF EMPLOYED POPULATION

The previous part defined the economically active population to be the sum of the employed and the unemployed population. This part presents statistical data on the size, distribution and characteristics of the employed population based on the definition given in the previous section.

A wide range of data was collected regarding the characteristics of employed population, which includes:

- Main type of occupation;
- Main product or service of the establishment or industry;
- Status in Employment of the main activity;
- Terms of employment for paid employees;
- Reasons for absence from work for those employed persons who worked less than one hour or does not work at all but have formal job attachment during the reference period;
- Amount of earnings from paid employees;
- Hours actually worked per week;
- Change of occupation, and reasons for changing the job;
- Job satisfaction and reasons for not being satisfied;
- Service year/ duration of work experience
- Whether employed persons were available or seeking to work additional hours
- Sector of the economy (Formal or informal employment sector);

4.2.1 Employment to Population Ratio

Employment to population ratio is one of the Key Indicators of Labour Market (KILM) used by the ILO to measure the size of employed persons in the entire population. It is calculated as a percentage of total employed persons to that of the working age population (ILO, 1999). The distribution of employment to population ratio of each Sub- cities by age group and sex is shown in Table 4.6. This Table also indicates Unemployment rate of each Sub-city by age group and sex.

4.2.2. Occupation and Industry

In this survey, the currently employed persons were asked about the type of main activity or occupation and major product or service of the establishment or industry in which they were engaged during the survey reference period. The questions used to identify the type of occupation and industry, were left open ended so that they will be filled in with the fullest description and its code in the field. For those employed persons engaged in multiple activities, the activity that took the largest share of the respondents' time was taken as the main type of activity.

The responses of the descriptions and codes for the type of occupation and industry filled in by enumerators were further checked and edited at the head quarter of the Central Statistical Agency using the National Occupational and Industrial Classifications (NOIC) code-book. The NOIC codes were adopted from the International Standard Classification of Occupation (ISCO-08) and International Standard Industrial Classification (ISIC, 2008/ Rev.4) by taking into account the prevailing national socio-economic conditions.

The NOIC uses a 4-digit coding systems corresponding to 4 levels classifications in successively details. In the cases of occupation and industry, the levels are ordered as major divisions, sub major divisions, and minor divisions. The occupational classification categorized into 10 major groups, 45 sub major groups and 131 minor groups. The industrial classification contains 21, 88 and 206 major, sub major and minor divisions.

The distribution of employed population of Addis Ababa by major occupational groups, age group and sex is presented in Table 4.7. Analogous information by major industrial divisions has been shown from Table 4.8, and Table 4.9.

4.2.3. Status in Employment

Status in employment of a person indicates the level of involvement and degree of decision-making in his / her main activity. In this survey, employed persons were asked about the status in employment of their main activity which was classified into: employer, paid employees, self-employed, unpaid family worker, apprentice, and member's of producers, cooperative and others categories. Paid employees were further disaggregated into employees-government, employees government parastatal, employees NGO's, employees private organization, employees domestic and other paid employees. However, domestic employees were excluded from paid employees since the analysis for Employment Survey of Addis Ababa is mainly interested on enterprise level employees.

Table 4.10 presents the distribution of status in employment by age group and sex for the City of Addis Ababa while the status in employment by major industrial divisions and sex is shown in Table 4.11.

4.3 UNEMPLOYMENT IN ADDIS ABABA

4.3.1 Introduction

Unemployment is one of the indicators that have been used to measure the extent of unutilized human resource in the economy at a given area or region in a certain period of time. It indicates the quantity and quality of the human labour a nation or a region would have, and should be used to promote its economic development, but not actually used. The unutilized human resource as a result of unemployment has its own social and economic implication. Therefore, the availability of reliable and timely statistical data on unemployment is vital to measure the extent of unutilized labour,

formulate and design new strategies as well as to monitor the existing employment policies.

A wide range of data regarding unemployment and the characteristics of unemployed population were collected in the 2013 Employment Survey of Addis Ababa. The data is useful to estimate the number of unemployed persons and rate of unemployment at various reporting levels.

This section presents the size of unemployed population and rate of unemployment in Addis Ababa at sub city levels. In addition, the characteristics of unemployed population such as age, sex, education, training status, previous work experience, duration of unemployment, type of jobs looking for, problems in establishing own business or enterprise, actions taken to seek work ... etc., are presented in detail. These information were collected from persons aged ten years and above by using the two known measurement approaches, namely current and usual approaches. But, the results presented in this section refer to only the current activity status approach for persons aged 10 years and above.

During the data collection period, respondents in the sampled household were asked detailed labour force questions using structured questionnaires. These includes:-

- whether they were seeking for employment in the past 3 months, if not reason for not seeking.
- whether available for work during the coming one month, if not reason for not being available,
- type of job looking for /i.e. self employment or paid employment or other/,
- type of problems faced to establish own business.
- previous work experience and duration of unemployment.

Based on the responses obtained from the respondents aged 10 years and above, the size and rate of unemployment was computed using the following methods of measurement.

4.3.2 Measurement of Unemployment

Unemployment is measured based on the standard definition three criteria that must be satisfied simultaneously: "without work", "currently available for work" and "seeking work" (ILO, 1983). The standard definition of unemployment is related to the "seeking work" criterion can be interpreted as activities or efforts that non-working persons performed to look for jobs (i.e., paid or self employment) during a specified reference period. The specific steps include registration at a public or private exchange; applying to employers; checking at worksites, farms, factory gates, market or other assembly places; placing or answering news paper advertisements; seeking assistance of friends or relatives; visit vacancy boards; looking for land, building, machinery or equipment to establish own enterprise, and arranging financial resources; applying for work permits and licenses...etc.

However, the standard definition of unemployment with its emphasis on seeking work criterion might be restrictive and might not fully capture the prevailing employment situations in many developing countries including Ethiopia, where the labour market is largely unorganized or of limited scope, where labour absorption is inadequate or where the labour force is largely self-employed.

Hence, the International standards introduced provisions, which allows for the relaxation of the seeking work criterion in certain situations. The provisions are two types, namely, partial relaxation and complete relaxation. Following the recommendations of the International standard and considering the prevailing national situations, the employment and unemployment and related labour force surveys used the above provisions to measure the different forms of unemployment. The definition of the two provisions is described as follows.

Under partial relaxation, the definition of unemployment includes discouraged job seekers, future start and layoffs in addition to persons satisfying the standard definition. Discouraged job seekers are persons who want a job but did not take any active step to search for work because they believe that they cannot find one. Future starts are those persons without work who have made arrangements to take up paid

employment or to undertake self-employment activity at a date subsequent to the reference period. Layoffs are persons whose contract of employment or activity has been suspended by the employer for a specified or unspecified period at the end of which the person concerned has a recognized right or recognized expectation to cover employment with the employer (ILO, 1990).

The completely relaxed definition of unemployment refers to persons without work and those who are available for work, including those who were or were not seeking work. That is, the seeking work criterion is completely relaxed and unemployment is based on the "without work" and "availability" criterion only. The availability in this situation is tested by asking the willingness to take up work for wage or salary in locally prevailing terms, or readiness to undertake self-employment activity; given the necessary resources and facilities. It should be noted that fulltime students are considered as available if and only if they are ready to withdraw from their studies in order to accept a job.

The Employment survey of Addis Ababa collected unemployment data in the standard, partially relaxed and completely relaxed options of measurements. After thorough evaluation and assessment of the results obtained using the three alternative and complementary measures; the rates obtained using the completely relaxed definition was found most plausible and hence selected for reporting. Those persons aged 10 years and above who had no work or did not work at least one hour or did not have job to return to, were asked whether they were available or willing to work if job was found during the coming one month. Those who responded "Yes" to this question were further tested whether they were ready to take a job under prevailing conditions. By doing so, those persons who had no job but available to work are considered as unemployed at the time of the survey.

4.3.3 Findings of the Survey on Unemployment

Unemployment rate is computed as percentage of the unemployed population over the total number of economically active population. The rate indicates the number of persons who are ready to participate or engaged in the production of goods and services.

The distribution of currently unemployed population of sub cities of Addis Ababa aged ten years and above together with unemployment rate by age group and sex is presented in Table 4.12. The survey result reveals that in June 2013, there were 409,467 unemployed persons, out of whom males were 138,635 and females were 270,833. The rate of unemployment of Addis Ababa was 24.2 percent in 2013. The corresponding rates of unemployment of males and females were 15.8 percent and 33.0 percent, respectively (Table 4.12). Besides, Table 4.13 also shows the rate of unemployment by sub city level.

The size of unemployed population of Addis Ababa aged ten years and above by literacy status, school attendance, unemployment rate and sex are presented in Table 4.3.3. The rate of unemployment of literate persons was 23.4 percent while the rate of illiterate persons was 31.2 percent in 2013. With regard to school attendance, persons who have not completed certificate were found more unemployed (39.5 percent) than others. In the entire educational category of highest grade completed, females were more unemployed than their counterpart (Table 4.14).

The distribution of economically active disabled population of Addis Ababa city by employment status, unemployment rate, age group and sex is shown in Table 4.15. The rate of unemployment for the disabled persons was 29.7 percent. Unemployment rate for female disabled persons was higher than male in most of the age group. Table 4.3.5 also provides data on the distribution of disabled population of Addis Ababa by sub Cities, economic activity and unemployment rate. The result shows that the highest unemployment (39.0 percent) of disabled persons was recorded in Addis Ketema and Yeka Sub Cities. The lowest rate was observed in Kirkos sub City (16.5 percent) in June 2013.

With regard to training, Table 4.17 presents the types of training for disabled population by employment status, unemployment rate and sex. The highest unemployment rate of disabled persons was observed for those who had training on infrastructure services (61.5 percent).

The distribution of unemployed population of sub cities of Addis Ababa aged ten years and above who have looked for work during the last three months prior to the survey date by steps taken and sex is presented in Table 4.18. Table 4.19 also shows unemployed population of sub cities of Addis Ababa aged ten years and above by type of work sought during the coming one month. The table shows that most of the unemployed (237,028) were ready to work any available job in the labour market.

Among unemployed population those who attempt to establish their own business were asked to state what problems they have faced. The problem that unemployed persons faced in trying to set up their own business is presented in Table 4.20. Table 4.21 also demonstrates economically active population of sub city of Addis Ababa aged ten years and above by major training category, employment status, unemployment rate and sex. The size of unemployed population for each sub city aged ten years and above by status of previous work experience and duration of unemployment and sex is presented in Table 4.22.

CHAPTER V

CHARACTERISTICS OF THE PAID EMPLOYED POPULATION

5. 1. Introduction

Paid employment jobs are those jobs where the employees hold explicit (written or oral) or implicit employment contracts, which give them a basic remuneration. Some or all of the tools, capitals, equipment, information systems and/or premises used by the employees may be owned by others. The employees may work under direct supervision or according to the strict guidelines set by the owner(s) or persons in the owners' employment. Persons in "paid employment" jobs are typically remunerated by wages and salaries, but may be paid by commission from sales, by piece rates, bonuses or in kind payments such as food, housing or clothing (ILO, 2000).

This chapter presents the statistical data on the size, distribution and characteristics of the paid employed population. For the purpose of paid employment, the age limit used in the previous chapters ten years and above was extended to fourteen years and above because of the fact that the labour proclamation no. 377/2003 forbids the employment of children under the age of 14 years. The law allows children to gain skill and engaged in light work/activities at this age and above for socialization. Based on this fact, the participation of children in paid employment especially in private organization can be treated in this survey. Therefore, the result in this section refers to persons aged 14 years and above.

The survey has collected the following information regarding the characteristics of the paid employed population which includes:-

- Main type of occupation;
- Main product or service of the establishment or industry;
- Status in employment of the main activity and terms of employment;
- Amount of earnings from paid employment;
- Change of the previous job/organization and reason for changing the job;
- Job satisfaction and reason for not being satisfied;
- The number of service year at work in paid employment.

5.2. Distribution of Status in Paid Employment

Status in paid employment of a person indicates the level of involvement and degree of decision-making his main activity. In this survey paid employed persons were asked about the status in paid employment of their main activity which was classified into: employees-government, employee government development organization, employees NGO's/ international organization, employee private organization and other paid employees.

Table 5.1 presents the distribution of status in paid employment of Addis Ababa city administration by age group and sex, while Table 5.2. for sub cities classified by sex. Table 5.3 and Table 5.4 contains data on the marital status of paid employees cross disaggregated by age group and sex for Addis Ababa city Administration and each sub city, respectively. The figures for status in paid employment classified by highest grade completed and sex for sub cities of Addis Ababa are presented in Table 5.5. Paid employed population's major industrial divisions by highest grade completed, educational attainment and sex for Addis Ababa city Administration are shown in Table 5.6 and Table 5.7, respectively. Likewise, paid employed population's major industrial division classified by age group and sex appears in Table 5.8. Mean while, Table 5.9, presents the distribution of paid employees by major occupational groups, age group, and sex for Addis Ababa City Administration. Moreover, paid employed population by major occupational group cross classified by major industrial divisions and sex revealed in Table 5.10. Please look at the clarification about occupation and industry appears in Chapter IV.

The status in paid employment also distributed by training status and types of training are shown from Table 5.11 to Table 5. 16. Training is an organized activity aimed at imparting information and/or instructions to improve the recipient's performance or to help him or her attain a required level of knowledge, experience and skill. A person is considered as trained if he/she has passed through any short or long term ability/skill development training program and given in or outside classroom in theory, in practice or both in comprehensive secondary schools, university, colleges, private and government organization, and must be awarded a certificate up on the completion of the training

program. The data for training status and types of training were collected in the 2013 National Labour Force Survey. Persons aged fourteen years and above were asked whether they have received professional, vocational / technical training before the survey period regardless of their status of education. Thus, those persons who have been received a certificate from secondary schools in any profession, vocational / technical subjects from university, college, public or private organization / institution in a short or long term training program are considered as trained. In addition, those persons who have been trained in more than one field; a training that took longer training period was recorded. Persons who received an award of certificate were asked to state the type of training they have received.

The training status and types of training cross tabulated by age group and sex for paid employees of Addis Ababa City Administration are presented in Tables 5.11 and Table 5.12 respectively. Table 5.13 indicates paid employed persons by status of training disaggregated age group and sex for the sub cities of Addis Ababa. Furthermore, paid employees by types of training, major industrial divisions and sex of Addis Ababa City Administration is presented in Table 5.14. The distribution of paid employees of Addis Ababa city classified by status in employment, types of training and sex is figure out in table 5.15, and for the sub cities of Addis Ababa in Table 5.16.

5.3 Labour Mobility/Change of the Previous Organization/

Labour/workers mobility defined as the geographical and occupational movement of workers. It consists change in the location of workers both across physical space (geographic mobility), and across a set of jobs (occupational mobility). In this survey, labour mobility refers to the change of their previous organization. Thus, paid employees were asked to state whether they changed the organization engaged in before. If they said "no" they were further respond to the type of their previous organization and reason for changing the job.

The distribution of paid employees who were changed the previous job and Reason for Leaving Previous Job as well as labour turn over rate cross classified by major industrial division and sex for Addis Ababa City Administration indicated in Table 5.17.

5.4. Job Satisfaction and Number of Service Year in Paid employment

Job satisfaction is defined as the level of contentment a person feels regarding his or her job. This feeling is mainly based on an individual's perception of satisfaction. Job satisfaction can be influenced by a person's ability to complete required tasks, the level of communication in an organization, and the way management treats employees.

Many organizations face challenges to accurately measuring job satisfaction, as the definition of satisfaction can differ for various people across an organization. However, most organizations realize that a worker's level of job satisfaction can impact on job performance. Despite general belief, studies have shown that high performing employees do not necessarily feel satisfied with their job because of high level titles or increased pay.

Typically, the five factors that can be used to measure and influence job satisfaction are:

- Pay or total compensation
- The work itself (i.e., job specification such as projects, responsibilities)
- Promotion opportunities (i.e., job enlargement, more prestigious title)
- Relationship with supervisor /employer
- Interaction and work relationship with coworkers

In order to capture information on job satisfaction and service year, some filtering questions were included in the questionnaire and administered to the respondents. Table 5.18 shows paid employees of sub cities of Addis Ababa Aged fourteen years and above by status of job satisfaction and sex. Besides, the distribution of paid employees' status of job satisfaction by major industrial divisions, status in employment and service year disaggregated by sex has also shown in Tables 5.19 -Table 5.20. Table 5.21-Table 5.23 portray paid employees by number of service year and terms of employment, major industrial divisions and sex for Addis Ababa City Administration, in that order, while Table 5.24 depicts paid Employees by Services Year, Major Industrial Divisions and Sex, Addis Ababa City Administration.

5.5. Earning from Paid Employment

In this survey, earnings for paid employees refer to gross remuneration and include bonus, overtime, allowances and other benefits that are obtained only from the main job. Table 5.25 shows the distribution of paid employees disaggregated by amount of total payment per month, status in paid employment and sex for Addis Ababa City Administration. Paid employees by Amount of Total payment, Terms of employment Sex also presented in Table 5.26. Similarly, paid employees by total amount of payment per month, number of service year and sex has shown in table 5. 27. Paid employees of Addis Ababa City Administration by type of training, sex and amount of payment per month has also revealed in Table 5.28. Analogous information, which deals with the major industrial divisions, occupational groups, marital status and household size are also shown in Table 5.29 to 5.32.

Filtering Question:-

Col.614:- (Circle the response of the respondent)

Is there any person who returned back from abroad (lived/worked there and/or intended to stay here for at least 6 months or more for vacation or business) ?

- 1=Yes → If the response is 'yes', then go to Col. 615 below.
2=No → End of this household questions, and go to another selected household.

Col.615:- For those who answer 'Yes' in Col.614, write the number according to their sex below.

Number	A. Male		
	B. Female		

For column 609

01. General such as fever, cold, etc	08. Animes	15. Fracture
02. Eye infection	09. Abrasion or scra	16. Dislocation
03. Ear infection	10. Burns	17. Eye injury
04. Skin problem	11. Cuts or puncture	18. Ear injury
05. Breathing problem	12. Amputation	19. Suffocation
06. Stiff neck	13. Piercing	20. Sinking
07. Back problem	14. Sprain	21. Other disease /specify/
		22. Other Injuries /specify/

ANNEX II

Estimation procedures of total, ratio and sampling errors

The following formulas were used to estimate the required variables by reporting levels.

1. **Estimate of domain total \hat{Y}_h for the two-stage sample design (Category I & II) is given by:**

$$\hat{Y}_h = \sum_{i=1}^{n_h} \frac{M_h H_{hi}}{n_h M_{hi} h_{hi}} \sum_{j=1}^{h_{hi}} Y_{hij} = \sum_{i=1}^{n_h} \sum_{j=1}^{h_{hi}} W_{hi} y_{hij} \text{-----} \quad (1)$$

Where,

$$W_{hi} = \frac{M_h H_{hi}}{n_h M_{hi} h_{hi}} \text{ is the basic sampling weight}$$

2. **The estimate of domain total \hat{Y}_h for the three-stage sample design (Category III) is given by:**

$$\hat{Y}_h = \sum_{i=1}^{n_h} \frac{M_h}{n_h n_{hi}} \sum_{j=1}^{n_{hi}} \frac{H_{hij}}{M_{hij} h_{hij}} \sum_{k=1}^{h_{hij}} Y_{hijk} \text{-----} \quad (2)$$

$$= \sum_{i=1}^{n_h} \sum_{j=1}^{n_{hi}} \sum_{k=1}^{h_{hij}} W_{hij} Y_{hijk}$$

Where,

$$W_{hij} = \frac{M_h H_{ij}}{n_h n_{hi} M_{hij} h_{hij}} \text{ is the basic sampling weight}$$

The following notations were used in the formula:

M_h = Total number of households in stratum h obtained from the sampling frame.

M_{hi} = Total number of households, in EA/ PSU i for the two-stage sample design or in urban center/PSU i for the three-stage sample design, stratum h obtained from the sampling frame.

n_h = Number of successfully covered sample EA's for the two stage sample design or urban centers for the three stage sample design in stratum h.

H_{hi} = Total number of households identified during the survey listing in EA/PSU i, stratum h (for the two-stage sample design).

h_{hi} = Total number of households successfully covered in EA/PSU i, stratum h (for the two-stage sample design).

M_{hij} = Total number of households in EA/SSU j, urban center/PSU i and stratum h obtained from the sampling frame (for the three-stage sample design).

n_{hi} = Number of sample EA's successfully covered in urban center/PSU i stratum h (for the three-stage sample design).

H_{hij} = Total number of households identified during the survey listing in EA/SSU j, urban center/PSU i and stratum h (for the three-stage sample design)

h_{hij} = Number of sample households successfully covered in EA/SSU j, urban center/PSU i and stratum h (for the three-stage sample design).

Y_{hij} = The observed value of a characteristic y for household j in EA/PSU i and stratum h (for the two-stage sample design).

Y_{hjk} = The observed value of a characteristic y for household k in EA/SSUj, urban center/PSU i and stratum h (For the three-stage sample design).

Note: Estimate of total at country level, \hat{Y} , is obtained by summing up stratum/domain total estimates.

$$\hat{Y} = \sum_{h=1} \hat{Y}_h$$

3. Sampling variance of the estimates:

Sampling variance of estimate of stratum total are given by the following formulas:

The variance of domain or reporting total estimate is:

$$V(\hat{y}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \hat{Y}_{hi}^2 - \frac{\hat{Y}_h^2}{n_h} \right] \text{-----} \quad (3)$$

in which $\hat{Y}_{hi} = W_{hi} \sum_{j=1}^{h_{hi}} Y_{hij}$ for the two-stage sample design

and $\hat{Y}_{hi} = \sum_{j=1}^{n_{hi}} W_{hij} \sum_{k=1}^{h_{hjk}} y_{hijk}$ for the three-stage sample design

Since the strata are independent,

$$V(\hat{Y}) = \sum_h V(\hat{Y}_h) \text{-----} \quad (4)$$

$$SE(\hat{Y}_h) = \sqrt{Var(\hat{Y}_h)} \text{-----} \quad (5)$$

4. Coefficient of variation (CV) and confidence interval (CI)

The following formulas were used to calculate CV and CI of the domain (reporting level) total.

The coefficient of variation (CV) of domain total in percentage is:

$$CV(\hat{Y}_h) = \frac{\sqrt{Var(\hat{Y}_h)}}{\hat{Y}_h} \times 100 \text{ ----- (6)}$$

and

Ninety five confidence interval (CI) of domain total:

$$\hat{Y}_h \pm 1.96 \times SE(\hat{Y}_h) \text{ ----- (7)}$$

5. Ratio estimates:

$$\hat{R}_h = \frac{\hat{Y}_h}{\hat{X}_h} \text{ and } \hat{R} = \frac{\hat{Y}}{\hat{X}} \text{ ----- (8)}$$

Where the numerator and the denominator are estimates of domain totals of characteristic y and x, respectively.

$$Var(\hat{R}_h) = \frac{1}{\hat{X}_h^2} [Var(\hat{Y}_h) + \hat{R}_h^2 Var(\hat{X}_h) - 2\hat{R}_h Cov(\hat{Y}_h, \hat{X}_h)]$$

In which

$$Cov(\hat{Y}_h, \hat{X}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \hat{Y}_{hi} \hat{X}_{hi} - \frac{\hat{Y}_h \hat{X}_h}{n_h} \right]$$

Estimates of standard error, coefficient of variation and confidence interval for the ratio estimate can be calculated by adopting formulas 5, 6 and 7.
