Household Energy Consumption Survey 1979/80

1. Objective of the survey:- Due to the over worsening energy problems of the country especially in the domestic sector and the urgent need of having reliable data upon which to base future actions in the field the Ethiopian National Energy Committee, Ministry of Mines, Energy and Water Resources and the Central Statistical Office undertook joint venture to carry out household energy consumption survey in Addis Ababa. The main aim of the survey was to measure the separate and aggregate consumption of all forms of energy in the household and study the possibility of providing alternative forms at the economic level of the inhabitants. The results of this and other similar surveys were to be utilized to forecast the future household requirements of different forms of energy and lay the basis for the formulation of an energy policy. The first round survey was undertaken in Hamle 1971 E.C. (July 1979G.C.) and the second round, in Yekatit 1972 E.C. (February 1980 G.C.) taking account of energy consumption during rainy and dry season, respectively.

2. Coverage

The survey was carried out among Ethiopian households in Addis Ababa and data on household consumption of various energy items were collected by interviewing each selected household.

The items covered were:-

2.1. Some demographic characteristic and economic aspects on each member of the selected household.

2.2. Purchased stock at the beginning, purchased during the survey month and, purchased stock at the end of the month of firewood, charcoal, naphtha, butane gas, electricity, candle/wax, dung cake, sawdust, drycells, gasoline, matches, agricultural waste, cotton seed, leaves and barks and other energy items.

2.3. Consumption of fuels obtained free during the survey month i.e., stock of free collection at the beginning plus free collection during the month minus free collected stock at the end of the month of the different energy items.

2.4. Consumption of fuel purchased and fuels obtained free for use of household industry during the survey month i.e. establishments (trade, handicraft, etc) run by the household in the premises where the household resided.

2.5. Capacity and purpose of appliances used by the household.

2.6. Cost of transportation of fuels purchased and free collected during the survey month.

2.7. Aggregate domestic expenditure of the household (food, drink, tobacco, energy etc.) during the survey month.

2.8. Household gross receipts (wages and salaries, overtime, pension, bonus, etc.) during the survey month.

3. Sample Design

A two stage stratified sampling was adopted. The first stage being the selection of 25 enumeration areas and the second stage, selection of 500 households i.e., about 2/1000 of the population of Addis Ababa. Addis Ababa was stratified into four zones and before the selection of enumeration areas, the 25 enumeration areas were allocated to each of the zones in proportion to their estimated population. Enumeration areas were then selected with probability proportional to size, size referring to population estimate obtained during delineation of enumeration area. In each of the selected enumeration areas 20 households were selected with simple random sampling which had been stratified into three groupings based on monthly income of the household i.e.,

1st group - households with monthly income of less than Birr 300.

2nd " - households with monthly income of equal to or greater than Birr 300 and less than Birr 600.

3rd " - households with monthly income of equal to or greater than Birr 600.

In each of the selected enumeration areas the distribution of the 20 sample households to each of these groups was based on the following identities:-

Let N_1 = total number of household listed in the first group.

N_2 = total number of households listed in the second group

N_3 = total number of households listed in the third group

n_1 = number of households selected from N_1

n_2 = number of households selected from N_2

n_3 = number of households selected from N_3

n_o = number of households (20) selected from an EA.

Indentities

a) $0.3 \times N_1 = a_1$

b) $0.4 \times N_2 = a_2$

c) $0.5 \times N_3 = a_3$

d) $a_1 + a_2 + a_3 = no$

e) $n_1 = \frac{n}{no} \times a_1$

$n_2 = \frac{n}{no} \times a_2$

$n_3 = \frac{n}{no} \times a_3$

$n = n_1 + n_2 + n_3$

4. Reference period

In most cases the reference period or the period to which data referred was past month. Information was collected by oral enquiry into the household. Data on consumption of different types of energy, selected items of domestic expenditure and receipts were collected for a reference period of past year.

5. Concepts and Definitions

5.1. Household:- All persons, whether related or not who normally live together in the same house or closely related premises and who take food from the same kitchen are defined to constitute a household. Persons living in hospitals, schools, army camps and the like were excluded.

5.2. Member of household:- All persons constituting the household are called the members of the household.

The total number of such members is called the household size. The following persons were considered as members of household:-

a) All persons who were members of the household and were present at the time of the survey including these who at the time of the survey were expected to be absent from the household for less than six months;

b) All guests who stayed with the household for six months and above or who were expected to stay for six months and above and,

c) Servants who lived with the household.

There are cases where single-person households or multi-households share a single housing unit or a room. In these cases the households were indentified on the bases of food preparation arrangements.

These persons who were once members but at the time of visit, were absent from the household for a period of six months and above, were not to be considered as members of the household. This refers to prisoners, students living in boarding schools, etc.

A head of household is defined as member of either sex, who for reasons of support, age or respect was considered as head by the members of the household or declares himself head. The head of the household is in charge of all household affairs.

5.3. Handicraft and cottage industries:- These are household industries run by the household in the premises where the household lived. These handicraft and cottage industries produce goods and services for sale.

Example:- 'Tella' and 'tej' production, tailoring, dying activities, bakeries, black smiths, pottery manufacture, ice cube production etc.

5.4. Trade:- This is buying and reselling of goods without transformation. The selling of any services is included under this category.

5.5. Income:- refers to wages and salaries, allowance, overtime, pension, bonus, employment benefits, discount made by employer for items bought by employee, rent received and imputed rent if rent - free or owned, interest received, profit and dividend received, sales of durable goods previously used for domestic purpose, sale or consumption of own crops, livestock and forestry products, sale of personal effects (jewellery and clothing etc.), domestic consumption of goods and services from household enterprise other than agriculture.

5.6. Receipts:- refer to income plus 'ekub' and 'edir' contribution, gifts and remitances received, net withdrawal from bank account, insurance received, loans taken and re-payment of loan received, and other receipts not stated above.

5.7. Domestic expenditure:- refers the total expenditure on food, drinks, tobacco, fuel and light (energy), water, laundry and cleaning materials and the like, clothing, footwear, textiles and jewellery, transportation, communication, medical cost, payments for durables items of personal use, payments for durable household items, reading and recreation, house rent and repairs and other household expenditures.

5.8. Payments:- refer to items under domestic expenditure plus interest paid, 'ekub' and 'edir' payments, gifts and remittance paid, net deposit in bank account, insurance paid, loans given and repayment of loans made.

6. Presentation and Analysis

The present report on the result of Addis Ababa Energy Consumption Survey has two major parts. The first part covers the sample and estimate results of the first round survey that was carried in Hamle 1971 E.C. (July 1979 G.C.). This gives the pattern of energy consumption in heavy rainy period. The second

part embraces both sample and estimate results of the second round survey that was undertaken in Yekatit 1972 E.C. (February 1980 G.C.) representing the pattern of energy consumption in the dry season.

The Addis ababa energy survey result is presented in seventy-two tables classified by household size, domestic expenditure and income group. In most tables value and quantity of domestic energy consumption per household and per person for different types of energy by income and expenditure group are provided. Estimates based on the five hundred households surveyed are also given.

About 76.8% - 78.5% of the households have income less than Birr 300 per month. 12.2% - 13% have between Birr 300 - 600. and about 9.4% - 10.2% greater than Birr 600. On the average, the monthly income of a household and a person is in the range of Birr 244.70 to 249.50, and Birr 48.40 to 50.80, respectively.

Marginal difference is noted on the energy consumption survey of July 1979 and February 1980 irrespective of the seasonal differences. This might be due to the climatic condition of Addis Ababa. On the average 10% to 12% of the household income is spent on various energy items. Mostly firewood is consumed, then charcoal, leaves and barks, electricity and butane gas, in that order. In the two rounds sharp difference is noted only in the consumption of dung cake ('kubet').

For more analysis refer to detail tabular presentations for both rounds.

7. Limitation of the Survey

To maintain the overall quality, strict supervision was undertaken at different stages. The work was coordinated by Expert Team Leader having two professional statisticians who were responsible for the coding, editing and verification of the work. In addition, one senior and four junior technicians did participate

in the office work. Machine editing was carried for checking possible inconsistencies. Before deploying the enumerators thorough training was given. Their work was checked on the spot by the supervisors in the field. Eventhough, eight field supervisors and twenty four enumerators participated in the survey some problems were faced in data collection.

7.1. Measurement problem:- weights in kg. and volume in cubic centimeter were used to measure leaves and barks, agricultural waste in some instances firewood.

In case of free collection of energy the price was imputed by using conversions prepared for each higher urban dwellers' association in Addis Ababa.

7.2. Memory relapse of the respondents:- since data for a month were collected on stock at the beginning, purchased during the survey month, and left over after the survey month, in some cases some households had a problem in recalling their expenditure. Luckly enough most of the surveyed population bought their energy type either on daily or weekly basis.

7.3. Refusal rate:- generally all the households were very co-operative and only in some instances substitutions were made. Substitutions were made for households who left the area, due to reasons of health or death and for whom the enumerator could not get information. All in all only three refused to co-operate.

TABLE 1a NUMBER OF HOUSEHOLDS AND PERSONS BY SEX, BROAD AGE AND HOUSEHOLD SIZE
