I. Introduction

Agriculture is the backbone of the Ethiopian economy and the main source of livelihood for over 85% of the population. It contributes about 48%¹ to the GDP and accounts for over 85% of the annual export earnings.

The livestock sub sector, which is an integral part of agriculture in Ethiopian context is contributing about 30% to the agricultural GDP and provides per capita consumption of about 8.2 kg/annum of meat and 16-18 kg/annum of milk². Livestock products, such as hides and skins have a considerable share in the export market and this indicates that the sub sector plays a predominant role in generating foreign export earnings and has a great potential for development. Moreover, livestock provide the major traction of energy utilized in agriculture and also serves as the main means of transportation in rural areas of the country. Hence, to raise income, improve the nutritional status of the population and thereby improve the living standard of rural population, the development of this sector is important.

The livestock sub-sector which is part and parcel of Ethiopia's agriculture did not get due attention in the development programs of agriculture. Almost all types of livestock in peasant holdings are indigenous and under traditional management systems and their output in terms of meat, milk, eggs ... etc. is low. Thus, to introduce modern management system and improve the quality of livestock, poultry population and

¹ The World Bank Atlas , Washington, D.C., 1995.

² Food Production, Food Security and Nutrition, Sub Programme-2 Agricultural Production, Technology, Addis Ababa, Sept. 1993

production system of beehives for the attainment of better productivity, reliable statistical data is essential.

The Central Statistical Authority has been conducting annual agricultural sample surveys since 1980/81 to estimate the livestock population privately owned by peasant households and cooperatives excluding nomadic areas. In addition, it has been compiling livestock data from ministry of State Farms Development (MSFD).

This publication contains time series data on livestock, poultry and beehives population from the agricultural sample surveys that were conducted annually from 1980/81-1991/92 (1973-1984 E.C.). During the early years of the surveys, information was mainly collected on number of livestock by sex and age. However, efforts have been made to cover more livestock characteristics such as breed and purpose category in latter years. More detailed results have been published for each survey annually. However, this report is intended to bring together and present these results for easy reference.

II. OBJECTIVES

The objective of the agricultural sample surveys which were conducted since 1980/81 was to collect basic quantitative information about the nation's agriculture that is needed for the preparation of short, medium and long term development plans, socio-economic policy formulation and establishment of national priorities.

III. COVERAGE

The agricultural sample surveys were conducted annually since 1980/81 (1973 /E.C.) until 1991/92 (1984 E.C.) excluded Eritrea, Tigrai and nomadic areas. Data on characteristics of livestock, poultry and beehives were collected from selected agricultural households in Sampled Farmer Associations (FAs), settlement areas and cooperatives. The number of sampled FAs/settlement areas were 500 in 1980/81-1985/86. In the latter years their number gradually increased in which 750 FAs were covered in 1986/87. In 1987/88 the number of FAs were raised to 864 and in 1988/89 (1981 E.C.) they reached 867. However, the coverage of sampled FAs, were slightly less in some years than were intended to be covered. Regarding producer cooperatives and state farms all were covered on total coverage bases.

IV. METHOD OF DATA COLLECTION

In each selected farmer association, every year a fresh list of all households were prepared and then agricultural households were identified from the total households. Of these, 25 agricultural households were selected using systematic or random sampling. Hence, information concerning livestock, poultry and beehives was collected by interviewing the holders within the sampled households, while data on co-operatives were gathered by interviewing their respective executive committee members. In addition, the Central Statistical Authority compiled livestock and poultry data from the records of the MSFD by sending appropriate forms. The reference date for enumerating livestock, poultry population and beehives was January 1st (G.C.) of each year.

V. DESCRIPTION OF RESULTS

This bulletin presents time series data on livestock, poultry and beehives for twelve consecutive years, 1980/81 - 1991/92 (1973 - 1984 E.C.). Particularly number of livestock by type, sex, age, purpose and breed categories are presented at national and regional levels.

In addition, the report comprises data on private holdings, cooperatives and state farms. According to the information presented in this bulletin the private peasant holding is the major source of livestock, poultry and beehives. It accounts for about 99% of cattle, sheep and goats and 96% of poultry. The average total estimates of cattle, sheep, goats and poultry for the 12 years are found to be 22.5 million, 9.3 million, 5.5 million and 19.5 million respectively.

As indicated in Table 8, the average proportion of exotic breeds in private peasant holding from 1989/90 - 1991/92 is 0.50% for cattle, 0.22% for sheep and 0.20% for goats.

The livestock data are presented by "old" and "new" administrative regions which were formed before the Transitional Government of Ethiopia i.e. prior to 1991. The data for the former regions for instance "Gamo Goffa" are presented for 1980/81 - 1987/88 and the data for the latter administrative regions for instance "North Omo" and "South Omo" are presented for 1988/89 - 1991/92. For users who are interested in comparing results of old and new administrative regions, lists of old regions and new regions are given in appendix I. However, it should be noticed that the area coverage of the old region is not strictly equal to the new regions formed from it. It could be used to give a crude comparison. In North Wollo no survey was carried in 1989/90 and 1990/91. However, number of livestock, poultry and beehives were estimated using growth model for

1989/90. On the national tables (Table 7, page 12), draught animals refer only to those animals engaged in agricultural practices such as ploughing, threshing and transporting to and from the farm.

Notes

In this publication all chicks are considered as male, merely for convenience and care should be taken in using the result. Zero value "0.00" indicates insignificant number at the unit of reporting of the variable and "-" indicates no data was reported. It should be noticed that regional sums would not sometimes equal to national total because of rounding. The regional estimates may be subject to higher sampling fluctuations. Thus, the possibilities of high sampling errors should be taken into account.

Finally, it is hoped that the results presented in this bulletin will create an easy reference to users on information of livestock over the past twelve years and helps to visualize the status of the livestock sub sector. Furthermore, the statistics will be useful in computing national accounts, preparing food balance sheets and in general for the preparation of sound agricultural development plan.
