I. INTRODUCTION AND OBJECTIVES OF THE SURVEY

1.1 INTRODUCTION

As it is true in most developing countries, in Ethiopia agriculture is the dominant sector of the economy. As a result of this, Ethiopian agriculture contributes the lion share of the GDP and foreign currency earnings of the country from the sell of agricultural outputs abroad as well as it creates employment opportunity to the majority of the country's population. Hence, agriculture is the major sector expected to play a dominant role to bring about an overall sustainable economic growth to the country, if strenuous efforts are made to modernize the farm activity of the sector as a whole.

Among the number of efforts that should be made by the concerned stakeholders to meet the desired goal mentioned above, the availability of reliable, comprehensive and timely statistical information on the overall performance of the sector is considered essential for use as a primary input to the planning, monitoring and evaluation of agricultural development.

In order to minimize the existing data gap, therefore, for the past three decades, the Central Statistical Authority (CSA) has been conducting the agricultural sample survey under which four integrated sample surveys designed for the collection of agricultural information on the performances of the sector were launched all over the country on annual basis. Hence, through performing these surveys, CSA used to disseminate the results obtained from these surveys to ultimate users annually. The 2004/05 (1997 E.C.) Belg Season Crop Production Sample Survey, for which this report is meant for, is among the four integrated sample surveys launched on annual basis under the umbrella of the agricultural sample survey all over the country.

This report, which is Volume IV of the six series of reports, presents quantitative results on crop land area, production, and yield of major Belg crops, grown during the 2004/05 Belg season by private peasant holdings as obtained from the results of the year 2004/05 (1997 E.C.) Belg Season Crop Production Sample survey.

1.2 Objectives of the Survey

The objectives of the 2004/05 (1997 E.C.) Belg Season Crop Production Sample Survey is to produce basic quantitative information on cropland area, production and yield of major Belg season crops, as well as to provide quantitative information on:-

- cropland area, production and yield of major belg season crops, and
- the extent and use of different farm management practices on belg season crops such as fertilized crop land area and quantity of fertilizer used by crop and fertilizer type, irrigated crop land area under improved seed, pesticide treated cropland area ... etc.

The adequate and timely supply of this information to ultimate users is therefore, important for use as a primary input in the process of policy formulation, designing developmental agricultural projects and programmes.

This report therefore presents quantitative information on the above-mentioned major variables at country and regional levels.

II. Survey Methodology, Data Collection and Processing

2.1 Scopes and Coverage

The 2004/5 (1997 E.C) Annual Agricultural Sample Survey (Belg Season) covered the entire rural parts of the country except three zones of Afar regional state and six zones of Somali regional state where its inhabitants are predominantly pastoralists. Accordingly the survey took into account of all parts of Harari, Addis Ababa and Dire Dawa, and 58 additional Zones / Special Weredas (that are treated as zones) of other regions. Besides, the survey could not also be accomplished in all the zones of Gambella region.

Initially, a total of 2,016 enumeration areas were selected to be covered by the survey, and the survey was successfully carried out in all sampled (100 %) EA's. As regard to the ultimate sampling unit, it was planned to conduct the survey on 50,400 agricultural households and 50,131 (99.47 %) households were actually covered by the Belg season

Agricultural Sample Survey. Distribution of the number of sampling units (planned and covered) by reporting level is presented in Table 2.1 below.

Table 2.1. Number of Zones / Strata Covered, Planned and Covered Enumeration Areas & Households by reporting level.

Reporting level	Number of Zones Covered	Enumeration Areas		Households	
		Planned	Covered	Planned	Covered
Tigray	5	164	164	4100	4063
Afar	2	56	56	1400	1398
Amhara	10	396	396	9900	9843
Oromia	14	536	536	13400	13349

SNNP	21	624	624	15600	15520
Harari*	1	24	24	600	600
Addis Ababa*	1	24	24	600	600
Dire Dawa*	1	24	24	600	599
Total	61	2016	2016	50400	50131

* = Values for these regions refer only the number of strata (domain of estimation)

2.2 Sample Design

A stratified two-stage cluster sample design was used to select the sample. Enumeration areas (EA's) were taken to be the primary sampling units (PSU's) and the secondary sampling units (SSU's) were agricultural households. Sample enumeration areas from each stratum were sub-samples of the 2001/2 (1994 E.C) Ethiopian Agricultural Sample Enumeration. They were selected using probability proportional to size systematic sampling; size being number of agricultural households obtained from the 1994 Population & Housing Census and adjusted for the sub-sampling effect. Within each sample EA a fresh list of households was prepared and 25 agricultural households from each sample EA were systematically selected at the second stage. The survey questionnaire was finally administered for those 25 agricultural households selected at the second stage. Information on area under crops, Belg season production of crops, agricultural practices, crop damage, and quantity of agricultural inputs used were obtained from the 25 households that were ultimately selected.

The sample size for the (2004/5) agricultural sample survey was determined by taking in to account of both the required level of precision for the most important estimates within each domain and the amount of resources allocated to the survey. In order to reduce non-sampling errors manageability of the survey in terms of quality and operational control was also in addition considered.

Except Harari, Addis Ababa and Dire Dawa, where the region as a whole were taken to be the domain of estimation, each zone of a region / special wereda that is considered to be a zone by itself was adopted as a stratum for which major findings of the survey are computed. However, by aggregating the results obtained from each zone the final report is provided only at regional & country level.

Estimation procedure for totals & ratios and their sampling errors are given in Appendix I. Estimates of standard errors and Coefficient of Variations for selected estimates are also presented in Appendix II.

Remark: As of the 2001/2 Ethiopian Agricultural Sample Enumeration, Addis Ababa City Administration had a total of 35 enumeration areas. However, during the 2004 Urban Economic Establishments Census it was found that some of the rural enumeration areas (EAs) were to be part of the urban areas of the city. Consequently only 24 enumeration areas were left as the rural EAs of the City Administration. Therefore, the 2004/5 (1997 E.C) annual Agricultural Sample Survey (Belg Season) covered all the 24 EAs with certainty. Hence, there could be great variation among estimates of area & crop production of the 2004/5 (1997 E.C) and that of the previous years.

2.3 Field Organization

The Central Statistical Authority (CSA) branch statistical office heads, field supervisors and enumerators, other supporting staff and drivers were all involved in the field operation activities of the **2004/05 (1997 E.C.)** Belg season Crop Production Sample survey. To accomplish the data collection activities, all field enumerators were equipped with the necessary survey equipment (i.e. compass, programmable calculator, protractor, ruler, measuring tape, balance scale, iron peg, ropes, sample bags... etc) at the completion of training. To assist with the fieldwork and data collection activities all available four-wheel drive vehicles were used for supervision and collection of completed questionnaires.

2.4 Training of Field Staff

The field staff-training program was carried out in two stages. The first stage consisted of trainees from the head office, branch statistical office heads statisticians and some of the field supervisors have been given training for one week at CSA's headquarters in Addis Ababa. Many of those trained in the first stage conducted similar training for field supervisors and enumerators for 10 days in CSA's 24 branch statistical offices, which are distributed all over the country. During the second stage training, the field staff were given detailed classroom instruction on the objectives and uses of the Agricultural Sample Survey (AgSS) concepts, and definitions of terms used, the method of area measurement, method of crop cutting, as well as correct interviewing procedures, ... etc. The enumerators' and supervisors' training also included a field practice to reinforce the concepts discussed in the classroom with regard to field measurement and crop cutting data collection.

2.5 Methods of Data Collection.

Except Cropland area of major Belg Season Crop, the data of which collected objectively using compasses and measuring tape, the information on production of major Belg Season crops and agricultural practices (uses of fertilizer, pesticide, improved seed and irrigation) were subjectively collected by interviewing the holders of sampled

households. **Appendix II**, illustrates the total number of EAs and households reporting for the **2004/05 (1997 E.C.)** Belg crop productions by region.

A major characteristic of Ethiopian agriculture is the existence of two well-known crop production seasons referred to as the Meher (or main) and Belg Seasons. The generally accepted definition of the Meher season is that of the long rainy season, which normally occurs from June to September. The Belg Season most often refers to small but timely rainy season, which normally occurs from February to May but in limited areas of the country. Generally, the Meher Season rainy period provides ideal growing conditions for the longer maturing crops. Planting and harvest of Meher crops can extend to December or January in some areas. Most of the time holders rely on short maturing crops for planting during the Belg rainy period and harvest of the crops is in June or July.

A point of contention arises with respect to the pure definition of the Belg crop. Belg cropping practices are heterogeneous across different portions of the country. The nature of the sowing period also overlaps with some of the Meher Season crops. Consequently, the report on Belg Season crops in the past faced a problem of a clearly defined growing period. It is important not to overlook or miss agricultural practices performed all year round due to use of irrigation or soil moisture from sufficiently dried areas that from time-to-time are swampy or marshy. To help clarify the two-crop season, the following definition has been in use since 1987/88:

Belg Season Crops were defined as any crops that are harvested during the months of March to August, while those crops that are harvested during September to February are considered Meher (or main) season crops.

This report consists of estimates of area, production and yield per hectare of major Belg Season crops for the year **2004/05 (1997 E.C.)**. The data collection period for obtaining the area, production and agricultural practices of the Belg season crops ranged from 'Sene' 15-30, 1996 E.C. (i.e. **From June 23 to July 7, 2004**). Data on area under Belg season crop are collected objectively using compass and measuring tapes, while

data on production of belg season crops were using subjective method based on face-to-face interviewing of the holder by the enumerator. Data on production of belg season crops are usually reported in local production measuring units that require conversion to an equivalent metric unit using the conversion factors available for local units at Wereda level prepared by CSA. The conversions factors have been constructed from experimentally derived data using actual holder production data associated with each local unit.

2.6 Data Processing

a. Editing, Coding and Verification

To insure the quality of the collected survey data an editing, coding, and verification instruction manual was written, and seventeen editors, data coders and verifiers were trained for one day to edit, code and verify the data using the aforementioned manual as a reference and teaching aid.

The enumerator completed edited and coded questionnaires sent to the head office were thoroughly verified by trained verifiers on a 100% basis before the questionnaires were sent to the data entry unit. The editing, coding, verification and data entry of all questionnaires was completed in thirty-one days.

b. Data Entry, Cleaning and Tabulation

Before starting data entry computer edit specifications were prepared for use on personal computers, utilizing the Integrated Microcomputer Processing System (IMPS) Software for data consistency checking purposes.

The data on the coded questionnaires were then entered into the IMPS software on personal computers. The data was then checked and cleaned using the computer edit specifications prepared earlier for this purpose. Fifty-six data encoders were involved in

this total process and it took fourteen days to complete the job. Finally, tabulation was done on personal computers to produce results as indicated in the tabulation plan.

2.7 BASIC CONCEPTS AND DEFINITIONS

For better understanding and ultimate use of the data presented in this report, the definitions of concepts and terminology used for the collection of all types of data of the 2004/05 (1997 E.C.) Belg season Crop Production Sample survey are presented here below: -

Enumeration Area (EA): An Enumeration Area_in rural parts of the Country is a locality that is less than or equal to a farmer's association area and usually it consists of 150-200 households.

Household:- A household may be either;

- a) a one person household, that is a person who makes provision for his own food or other essentials for living without combining with any other person to form part of a multi person household or
- b) a multi person household, that is, a group of two or more persons who live together and make common provision for food or other essentials for living. The persons in the group may pool their incomes and have a common budget to greater or lesser extent. They may be related unrelated persons, or a combination of both.

Agricultural Household:- A household is considered an agricultural household when at least one member of the household is engaged in growing crops and/or breeding and raising livestock in private or in partnership with others.

Holder:- A holder is a person who exercises management control over the operations of the agricultural holding and takes the major decision regarding the utilization of the available resources. He has technical and economic responsibility for the holding. He may operate the holding directly as an owner or as a manager.

Under conditions of traditional agricultural holding the holder may be regarded as the person, who with or without helps, of others, operates land or raises livestock in his own right, i.e. the person who decides on what, when where and how to grow crops or raise livestock and has right to determine the utilization of the products.

Holding: - A holding is all the land and livestock kept which is used wholly or partly for agricultural production and is operated as one technical unit by one person alone, or with others, without regard to title, legal form, size or location.

Parcel: - A parcel of holding is any piece of land entirely surrounded by land, Water, road, forest, ... etc. Which is not part of the holding. It may consist one or more cadastral units, plots or field adjacent to each other.

Field: - A field is defined as any plot of land, which is a parcel or part of a parcel under the same crop.

Belg Season Crops: - are defined as any crops that are harvested during the months of March (Megabit) to August (Nehase).

Meher Season Crops: - are those crops that are harvested during September (Meskerem) to February (Yekatit) are considered as main (Meher) season crops.

Irrigated area: - refers to the area of land purposely and actually provided with water, other than by rain, for improving the production of crops. The uncontrolled flooding of land by the over flow of rivers or streams is not categorized as irrigation practice although sometimes farmers use this incidence for production.

Improved Seed: is defined as crop variety, which gives significantly higher yield, better quality and/or better benefit compared to traditional varieties of seeds, and usually produced by the Ethiopian Seed Enterprise (ESE) in Ethiopia.

Fertilizer: - refers to anything added to the soil intended to increase the amount of plant nutrients available for crop growth. Usually fertilizers are divided into two parts, Natural and commercial. Examples of natural fertilizers are farmyard manure and wood ashes

while commercial fertilizers are DAP (Di-Ammonium phosphate) and UREA (Ammonium Nitrate).

Pesticides: Pesticides are chemicals useful for the mitigation, control or elimination of pests which are trouble some or harmful to crop. Insecticides, herbicides and fungicides are all considered as pesticides.

III. SUMMARY OF THE MAJOR FINDINGS OF THE SURVEY.

In this part of the report the estimates of total Belg cropland area and production of the 2004/05 (1997 E.C.) Belg season are presented. The following are discussions on the major findings of the 2004/05 Belg season crop production survey.

According to the 2004/05 (1997 E.C.) Belg season crop production sample survey results, it is estimated that major Belg crops covered about 982.80 thousand hectares of land and a total of 6670.91 thousand quintals of production was obtained at country level. Out of this total cropland area under Belg crops, the highest which is about 796.49 thousand hectares (81.04%) were under cereals followed by pulses that covered about 176.64 thousand hectares (17.97%), and about 9.67 thousand hectares (0.99%) were covered by oilseed crops.

From the above-mentioned total cropland area, an estimated production of about 6236.55 thousand quintals (93.49%) and 421.41 thousand quintals (6.32%) of cereals and pulses are obtained at country level, respectively.

Summary Table A. Estimates of Total Area and Production of Major Belg season Crops for Private Peasant Holdings in Ethiopia, 2004/05 (1997 E.C.)

Crop Type	Total Area		Total Production	
	In thousands (ha.)	%	In thousands (Ql.)	%
Cereal	796.49	81.04	6236.55	93.49
Pulses	176.64	17.97	421.41	6.32
Oilseeds	9.67	0.99	*	*
All Crops	982.80	100.00	6670.91	100.00

3.1. General Over-view on the Performance of Crop Production

Activities of the 2004/05 Belg Season as compared to the 2003/04(1996 E.C.)

In this section of the report an attempt is made to compare the performance of Belg seasons of the year **2003/04 (1996 E.C.)** with that of the **2004/05 (1997 E.C.)** Belg Season in terms of total cropland area, production and yield of major Belg season crops. (See Tables 1 and 2).

As indicated in Table 1, one can easily observe that the **2004/05 (1997 E.C.)** Belg season crop production activities is better, by 9.51% for area and by 101.94% for production, when compared to the **2003/04 (1996 E.C.)** Belg season cropland area and production estimates. A very clear indicator for this is that in the year **2004/05** Belg season crop production activities, Belg crops were grown on a total area of **982.80** thousand hectares with a corresponding production of 6670.91 thousand quintals; where as the estimates of area and production for the year **2003/04** were **897.42** thousand hectares and **2704.84** quintals, respectively.

A close evaluation of the performance of each Belg crop have indicated that some of the Belg crops like, teff,, haricot beans and barley have shown a significant increase in crop production, i.e. **1198.28%** increase in crop area and **2178.01%** increase in production for teff, through **2.60%** increase in crop area and **517.54%** increase in production for barley. (For details see Table 1)

As it can be observed from the comparison made in both tables (Tables 1 and 2), one can easily conclude that both the total area covered by Belg Season crops and the respective volume of production produced in the year **2004/05(1997 E.C)** has shown a significant increase compared to that of the year **2003/04 (1996 E.C)**.

3.2 Results of 2004/05 (1997 E.C.) Both Seasons (Meher and Belg)

In this section of the report, an attempt is made to present the total cropland area and production of major crops obtained during the year 2004/05 (1997 E.C.) both season harvest. Accordingly, Summary Table B-D presents the estimates of area and production of major crops for both Meher and Belg seasons.

The total area and production of major crops in 2004/05 (1997 E.C.) both seasons, was estimated to be 10.72 million hectares and 125.75 million quintals, respectively.

Out of the above mentioned totals, 0.91 (8.49%) million hectares and 6.67(5.30%) million quintals was the contribution of Belg season. (For the details see Figs 1 and 2, and Summary Tables B and C).

Figure 1. Estimates of total area under major crops for private holdings in Ethiopia for both seasons 2004/05(1997 E.C.)

Out of the total output of major crops (both Meher and Belg Seasons) of 2004/05 (1997 E.C.) the total area under Cereals accounted for about 8.44 million hectares (78.73%) with a production of 106.55million quintals (84.73%).

Figure2. Estimates of total production of major crops for private holdings in Ethiopia for both seasons 2004/05 (1997 E.C)

About 1.45 million hectares (13.53%) with a production of 13.80 million quintals (11.05%) accounted for pulses, and 0.83 million hectares (7.74%) with a production of 5.27 million quintals (4.22%) accounted for oil seeds. For details see summary Table B).

Summary Tabel B. Total Area and Production of Major Crops for Private Peasant Holdings in Ethiopia Both Seasons, 2004/05 (1997 E.C.)

TYPE OF CROP	AREA IN MILLION HECTARES					
	MEHER	%	BELG	%	BOTH	%
CEREALS	7.64	77.88	0.80	87.91	8.44	78.73
PULSES	1.35	13.76	0.18	10.99	1.45	13.53
OILSEEDS	0.82	8.36	0.01	1.10	0.83	7.74
Total	9.81	100.00	0.91	100.00	10.72	100.00

TYPE OF CROP	PRODUCTION IN MILLION QUINTALS					
	MEHER	%	BELG	%	BOTH	%
CEREALS	100.31	84.24	6.24	93.49	106.55	84.73
PULSES	13.50	11.34	0.42	6.32	13.92	11.07
OILSEEDS	5.27	4.42	*	*	*	*
TOTAL	119.08	100.00	6.67	100.00	125.75	100.00

3.3 Comparison of 2003/04 and 2004/05 of Both Seasons (Meher and Belg)

Area and production of Major Crops

Comparison of the total area and production of 2003/04 (1996 E.C.) and 2004/05 (1997 E.C.) was made for both seasons and Belg season separately, in summary Tables C and D, respectively.

Summary Table C. Total Cropland area and Production of Major Crops for Private Peasant Holdings in Ethiopia (Both seasons), 2003/04 (1996 E.C.) and 2004/05 (1997 E.C.)

TYPE OF CROP	AREA IN MILLION HECTARES			PROD. IN MILLION QUINTALS		
	2003/04 (1996 E.C)	2004/05 (1997 E.C)	% age CHANGE	2003/04 (1996 E.C)	2004/05 (1997 E.C)	% age CHANGE
CEREALS	7.79	8.44	8.34	92.71	106.55	14.93
PULSES	1.20	1.45	20.83	10.42	13.92	33.59
OILSEEDS	0.58	0.83	43.10	3.13	*	*
TOTAL	9.57	10.72	12.02	106.26	125.75	18.34

Accordingly, the 2004/05 (1997 E.C.) both seasons' total outputs of the major crops have increased by 12.02% in area, and by 18.34% in production as compared to the 2003/04(1996) results. Similarly, the 2004/05 (1997 E.C.) total area and production for major Belg Season crops has increased by 11.24% and 146.13%, respectively, as compared to the 2003/04 (1996 E.C) Belg Season crops. For details refer to summary Table D.

Summary Table D. Total Cropland Area and Production of Major Belg Season Crops For Private Peasant Holdings in Ethiopia, 2003/04 (1996 E.C.) and 2004/05 (1997 E.C.)

Belg Season

TYPE OF CROP	BELG SEASONS					
	AREA IN MILLION HECTARES			PRODUCTION IN MILLION QUINTALS

* Excluding Gambella Region

Comparison of the total area and production of 2003/04 (1996E.C.) and 2004/05 (1997 E.C.) was made for Belg reporting regions, and is presented in Table 2.

When we compare nationally, the general trend shows an increase in both area and production. An independent observation of each region actually shows a decrease of area in Tigray, Afar and Somale Regions. On the other hand, an increase in production had been observed in Somale, S.N.N.P, Amhara, and Oromiya, out of which the increase in area of Harari and the increase in production of Somale are significant, i.e, 375.00% and 2424.58%, respectively. Tigray region is the only region in which a decrease in production has been observed.

NOTES: -

1. *Some estimates in all reporting levels are excluded due to high coefficient of variations. Nevertheless, they are incorporated in the total estimates. Hence the sum of the specific estimates may not be equal to the total estimates.*
2. *Users are also advised to use those estimates with 30-50% coefficient of variation (CV) cautiously*
3. *Even though area is reported for some crops in some reporting levels, no production data is available such cases are designated by Not Stated (NS). On the other hand, in all tables “-” labeled for data not available totally.*
4. *All Estimates Exclude Gambella Region*

following formulae were used to estimate total area of land under specific crop, production and yield of specific crop in a stratum.

For Estimating Total Area of Land Under Specific Crop:

$$A_h = \sum_{j=1}^m W_{hj} \sum_{i=1}^{n_j} a_{ij} = \sum_{j=1}^m W_{hj} A_{hj}$$

in which, $W_{hj} = \frac{M_{hj} H_{hj}}{n_j m_j h_j}$ is the basic weight.

Appendix I

Estimation Procedures of Totals, Ratios and Sampling Error

- is the total number of sample EAs successfully covered in the h^{th} stratum
- is the measure of size of the i^{th} sample EA in the h^{th} stratum obtained from the sampling frame
- is the total number of agricultural households of the i^{th} sample EA in the h^{th} stratum
- is the number of sample agricultural households successfully covered in the i^{th} sample EA in the h^{th} stratum
- is the value of area for agricultural households j in the i^{th} EA in the h^{th} stratum under a specific crop
- is the sample total area under specific crop for EA j in stratum h
- estimate of total area under specific crop in stratum h

For Estimating Total Production Under Specific Crop:

$$P_h = \sum_{j=1}^m P_{hj}$$

in which, $P_{hj} = a_{ij} \cdot Y_{ij}$

The following formulas were used to estimate total area of land under specific crop, production and yield of specific crop in a stratum.

1. For Estimating Total Area of Land Under Specific Crop:

$$\hat{A}_h = \sum_{i=1}^{n_h} W_{hi} \sum_{j=1}^{h_{hi}} a_{hij} = \sum_{i=1}^{n_h} W_{hi} a_{hi}$$

in which, $W_{hi} = \frac{M_h H_{hi}}{n_h m_{hi} h_{hi}}$ is the basic weight.

Where:

- h represents the stratum
- n_h is the total number of sample EAs successfully covered in the h^{th} stratum.
- M_h is the measure of size of the h^{th} stratum as obtained from the sampling frame.
- m_{hi} is the measure of size of the i^{th} sample EA in the h^{th} stratum obtained from the sampling frame.
- H_{hi} is the total number of agricultural households of the i^{th} sample EA in the h^{th} stratum.
- h_{hi} is the number of sample agricultural households successfully covered in the i^{th} sample EA in the h^{th} stratum.
- a_{hij} is the value of area for agricultural households j , in the i^{th} EA in the h^{th} stratum under a specific crop.
- a_{hi} is the sample total area under specific crop for EA i in stratum h
- \hat{A}_h estimate of total area under specific crop in stratum h

2. For Estimating Total Production Under Specific Crop:

$$\hat{P}_h = \sum_{i=1}^{n_h} W_{hi} P_{hi}$$

in which, $P_{hi} = a_{hi} * \bar{Y}_{hi}$

Where, $\bar{Y}_{hi} = \frac{Y_{hi}}{16C_{hi}}$ is average yield per square meter of a specific crop in the i^{th} EA in the h^{th}

stratum.

\hat{P}_h is estimate of total quantity of production of a specific crop in the h^{th} stratum.

Y_{hi} is sample total quantity of production of a specific crop from defined area of land for crop cutting of a crop in the i^{th} EA in the h^{th} stratum.

P_{hi} is estimate of total quantity of production under specific crop for EA i in stratum h .

C_{hi} is the number of crop cutting of a specific crop in the i^{th} EA in the h^{th} stratum.

3. For Estimating Yield of a Specific Crop in Stratum h :

$$\hat{Y}_h = \frac{\hat{P}_h}{\hat{A}_h}$$

4. Sampling Variance of Estimates:

Sampling variance for the estimate of stratum total of area, production and yield for a specific crop are estimated by the following formulas.

$$Var(\hat{A}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{A}_{hi} - \frac{\hat{A}_h}{n_h} \right)^2 + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{A}_{hij} - \frac{\hat{A}_{hi}}{h_{hi}} \right)^2$$

$$Var(\hat{P}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{P}_{hi} - \frac{\hat{P}_h}{n_h} \right)^2 + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{P}_{hij} - \frac{\hat{P}_{hi}}{h_{hi}} \right)^2$$

$$Var(\hat{Y}_h) = \frac{1}{\hat{A}_h^2} \left[Var(\hat{P}_h) + \hat{Y}_h^2 Var(\hat{A}_h) - 2\hat{Y}_h Cov(\hat{P}_h, \hat{A}_h) \right]$$

Where,

$$Cov(\hat{P}_h, \hat{A}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{A}_{hi} - \frac{\hat{A}_h}{n_h} \right) \left(\hat{P}_{hi} - \frac{\hat{P}_h}{n_h} \right) + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{A}_{hij} - \frac{\hat{A}_{hi}}{h_{hi}} \right) \left(\hat{P}_{hij} - \frac{\hat{P}_{hi}}{h_{hi}} \right)$$

f_h = average first stage probability of selection of EAs within stratum h .

$f_{hi} = \frac{h_{hi}}{H_{hi}}$ = average second stage probability of selection within the i^{th} sample EA in stratum h .

$\hat{A}_{hi}, \hat{P}_{hi}$ are weighted total area and production, respectively, of a specific crop in the i^{th} EA and h^{th} stratum.

$\hat{A}_{hij}, \hat{P}_{hij}$ are weighted values of area and production, respectively, from j^{th} agricultural household in the i^{th} EA and h^{th} stratum under a specific crop.

Since all strata are independent, the total variance at regional and country level is computed by aggregating the result obtained at Zone/Special Wereda level, i.e.

$$Var(\hat{A}) = \sum_h^L Var(\hat{A}_h), Var(\hat{P}) = \sum_h^L Var(\hat{P}_h) \text{ and } Var(\hat{Y}) = \sum_h^L Var(\hat{Y}_h)$$

Where, L is the number of strata (Zone/Special Wereda).

In estimating the sampling variance by the above formula, selection of EAs within a stratum is assumed to be with replacement. By so doing the variance estimate may be slightly over estimated but it greatly simplifies the estimation procedure.

5. Coefficient of Variation (CV) of Estimates:

Coefficient of Variation (CV) in percentage of estimate of stratum total of area, production and yield for a specific crop are given by:

$$CV(\hat{A}_h) = \frac{\sqrt{Var(\hat{A}_h)}}{\hat{A}_h} * 100, CV(\hat{P}_h) = \frac{\sqrt{Var(\hat{P}_h)}}{\hat{P}_h} * 100, CV(\hat{Y}_h) = \frac{\sqrt{Var(\hat{Y}_h)}}{\hat{Y}_h} * 100$$

6. Ninety-Five Percent Confidence Interval (CI) of Stratum Total of Area:

$$\hat{A}_h \pm 1.96 * SE(\hat{A}_h),$$

Where $SE(\hat{A}_h) = \sqrt{Var(\hat{A}_h)}$ is standard error of the estimate of the stratum total of area.

Estimates of standard error and confidence interval for the other estimates can also be calculated by adopting the above formulas.

Appendix III - Questionnaires

Crop Production Sample Survey
List of Fields Under Temporary Crops (Including Vegetables and Root Crops) and Agricultural Practices
(Belg Season) - 2004/05 (1997 E.C)

Part I - Identification Particulars

1	2	3	4	5	6	7	8	9	10	11	12	13	14
Region	Zone	Wereda	Farmers' Association	Enumeration Area	House hold ID Number	Holder ID Number	Sex of head of House hold M = 1 F = 2	Name	Holder		Educational Status	House hold Size	Type of Holding Crop = 1 Livestock = 2 Both = 3
									Age	Sex M = 1 F = 2			

Part II. Area Under Temporary Crops and Agricultural Practices

and Area Measurement Result

1	2	3		
Sr. No.	Questions	Parted No.	Field No.	Crop Name
1	Type of Holding Private = 1 Rents/Contract = 2 Ot			
2	Crop Production in local unit	Local unit	Code	quantity
3	Have the field been included in the extension package program Yes = 1 No = 2			
4	Was the field irrigated? Yes = 1 No = 2			
5	Variety of seeds used Improved = 1 Indigenous = 2			
6	(For Cereals, Pulses and oil seeds only) If indigenous seed was used, What was the total Quantity		Kg	gram
7	(For Cereals, Pulses and oil seeds only) If improved seed was used What was the total quantity		Kg	gram
8	(For Cereals, Pulses and oil seeds only) If improved seed was used What was the cost/price		Birr	cent.
9	Was the crop damaged Yes = 1 No = 2			
0	If you, what was the major causes of damage Percentage of damage	Reason		code
1	Percentage of damage			
2	Any control/prevention measure taken for crop damage? Yes = 1 No = 2			
3	If Yes, What type of measure? Chemical = 1 Both = 3 Non Chemical = 2			
4	If Chemical Insecticide = 1 1&3 = 5 Herbicides = 2 2&3 = 6 fungicide = 3 All = 7 1&2 = 4			
5	What was field fertilized? Yes = 1 No = 2			
6	If fertilized What type? Natural = 1 Both = 3 Chemical = 2			
7	If chemical fertilizer used 17.1 Type Urea = 1 Both = 3			
	17.2 Quantity in Kg		Kg	gram
8	If Natural fertilizer used mainly what type? Manure = 1 1 & 3 = 5 Compost = 2 2 & 3 = 6 Orga = 3 All = 7 1 & 2 = 4 Others (Specify) = 8
